# Experimental High Energy Physics Research at UCSB

*Joe Incandela, for the UCSB High Energy Group; May 24, 2002*

# Gauge Fields

- EM: field potentials  $\Rightarrow$  gauge freedom  
 $\partial_\mu F^{\mu\nu} = j^\nu = (\rho, \mathbf{j})$  ( $F^{\mu\nu} \equiv \partial^\nu A^\mu - \partial^\mu A^\nu$ )  
 $\partial^\mu \partial_\mu A^\nu - \partial^\nu (\partial_\mu A^\mu) = j^\nu$   
 $\rightarrow$  Maxwell eqns. invariant for  
 $A^\mu \rightarrow A'^\mu = A^\mu + \partial^\mu \chi$
  - QM: phase invariance  $\leftrightarrow$  gauge invariance  
 $\partial_\mu \rightarrow D_\mu = \partial_\mu + i q A_\mu$   $\equiv$  covariant derivative
  - QFT: Fields become operators
    - QED Free massless photon Lagrangian  
 $L_{em} = -1/4 F^{\mu\nu} F_{\mu\nu}$
    - $L_{em} = -1/4 F^{\mu\nu} F_{\mu\nu} + (m^2/2) A^\mu A_\mu$  not gauge invariant!
    - Covariant derivative  $\rightarrow$  particle interactions
      - Lagrangian for free Dirac spinors:  
 $L_D = \bar{\Psi} (i \gamma^\mu \partial_\mu - m) \Psi$
      - Gauge/phase invariance  $\partial_\mu \rightarrow D_\mu = \partial_\mu + ie A_\mu$   
 $L_D \rightarrow L'_D = L_D + j^\mu A_\mu$  where  $j^\mu = e \bar{\Psi} \gamma^\mu \Psi$
- $L = -1/4 F^{\mu\nu} F_{\mu\nu} + \bar{\Psi} (i \gamma^\mu \partial_\mu - m) \Psi + j^\mu A_\mu$
- Euler-Lagrange  $\rightarrow \partial^\mu \partial_\mu A^\mu - \partial^\mu (\partial_\nu A^\nu) = j^\mu$
- Gauge theories
    - Classical EM Gauge Invariance
    - Quantum Mechanics Phase Invariance
      - presence of  $A_\mu$
    - Quantum Field Theory
      - QED - U(1)
        - gauge invariance  $\Rightarrow$  massless photon
      - QCD - SU(3)<sub>c</sub>
        - Gauge invariance implies massless gauge quanta (8 gluons)
        - Quark confinement  $\rightarrow$  jet production
  - The weak nuclear force ?

# Weak Force

---

- Weak Nuclear Force
  - Hints of SU(2) gauge symmetry
    - Doublets
    - Universal Coupling  $G_F$
  - But short-ranged  $\Rightarrow$  massive gauge quanta
    - Interactions only observed over short distances (effectively contact interactions)
    - Coupling  $G_F \sim 1/M^2$
  - How to reconcile ?

- An example from Nature: Superconductivity

$$j^\mu = (-q^2/m) |\psi|^2 A^\mu \text{ (London)}$$

$$\partial^\mu \partial_\mu A^\nu - \partial^\nu (\partial_\mu A^\mu) = (-q^2/m) |\psi|^2 A^\nu \equiv -M^2 A^\nu$$

Cooper pair (boson) wavefunction  $\psi$  with non-zero constant ground state  
 $\rightarrow$  massive photon!

Supercurrents screen the EM field making it effectively short-range

.: Massive gauge quanta are possible when gauge symmetry is broken!

# EWK Symmetry Breaking

---

- Glashow Weinberg Salam  $SU(2) \otimes U(1)$

$$L = -\frac{1}{4} W^{\mu\nu} \cdot W_{\mu\nu} - \frac{1}{4} B^{\mu\nu} B_{\mu\nu}$$

$$W^{\mu\nu}_i = \partial^\nu W^\mu_i - \partial^\mu W^\nu_i + g \epsilon^{ijk} W^\mu_j W^\nu_k \quad B^{\mu\nu} = \partial^\nu B^\mu - \partial^\mu B^\nu$$

- Add a scalar doublet field

$$\phi^\dagger = 2^{-1/2} (\phi_1 - i\phi_2, H - i\phi_0) \text{ with potential } V(\phi) = \mu^2 \phi \phi^\dagger + \lambda |\phi \phi^\dagger|^2 \quad (\lambda > 0)$$

- This is the most general  $SU(2)$  invariant and renormalizable potential
- (e.g. Gibb's free energy in ferromagnetism)
- $\mu^2 > 0$  symmetry retained  $(T > T_c)$
- $\mu^2 < 0 \Rightarrow \langle \phi \rangle_0 \neq 0.0$   $(T < T_c)$

$$L_\phi = (D_\mu \phi)^\dagger (D_\mu \phi) - V(\phi)$$

- where  $D_\mu = \partial_\mu + ig(\tau/2) \cdot W_\mu + ig'/2 B_\mu$
- choose gauge with  $\phi^\dagger = 2^{-1/2} (0, v + H), \langle H \rangle_0 = 0$

⇒ Lagrangian now has 3 Massive Vector Gauge Bosons and massless photon:

$$W_\mu^\pm = 2^{-1/2} (W_\mu^1 \pm W_\mu^2) \quad M_W^2 = \frac{1}{4} g^2 v^2$$

$$Z_\mu^0 = (g^2 + g'^2)^{-1/2} (-g' B_\mu + g W_\mu^3) \quad M_Z^2 = \frac{1}{4} (g^2 + g'^2) v^2$$

$$A_\mu = (g^2 + g'^2)^{-1/2} (g B_\mu + g' W_\mu^3) \quad M_A^2 = 0$$

# The Higgs & its couplings

- Electroweak Couplings satisfy  
 $g \sin \theta_W = e = g' \cos \theta_W \quad (M_Z = M_W / \cos \theta_W)$

From  $\mu$  decay  $G_F/2^{1/2} = g^2 / 8M_W^2 = 1 / 2v^2$

$$\Rightarrow M_W \sim 80 \text{ GeV}$$
$$M_Z \sim 91 \text{ GeV}$$

- In the process, also generate masses for fermions:

$$L = \lambda_d \underline{Q}_L \phi d_R$$
$$\lambda_d = 2^{1/2} m_d/v \sim m_d/M_W$$

- The coupling is proportional to the fermion mass

e.g. top quark:

$$\lambda_t = 2^{1/2} m_t/v = 2^{1/2} (174.1)/(246) = 1$$

$$\Gamma(H \rightarrow f\bar{f}) = (N_c g^2 / 32\pi) (m_f^2 / M_W^2) (1 - 4m_f^2/M_H^2) M_H$$
$$\Gamma(H \rightarrow W^+W^-) = (g^2 / 128\pi) (M_H^2 / M_W^2) f(x) M_H$$

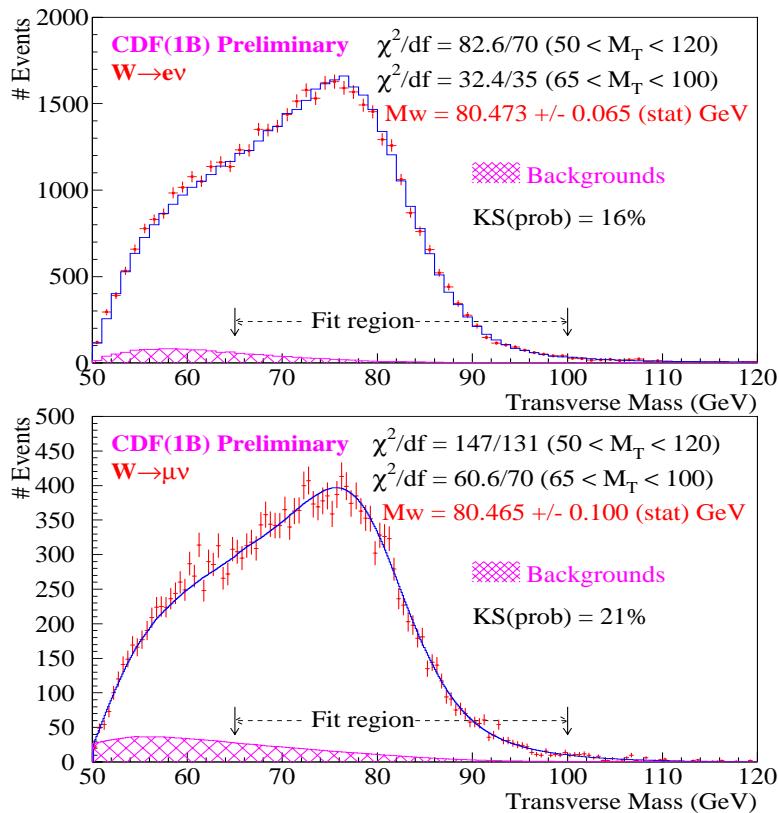

where  $f(x) = (1-x)^{1/2} (1-x+3x^2/4)$   
and  $x = 4 M_W^2 / M_H^2$

$$\Gamma(H \rightarrow W^+W^-) / \Gamma(H \rightarrow f\bar{f}) \sim M_H^2 / m_f^2$$

And the Higgs term itself:

$$2v^2 \lambda H^2 \Rightarrow M_H = (2\lambda)^{1/2} v$$

- We know everything about the Standard Model Higgs except
  - its mass
  - whether or not it exists

## W-Boson Mass [GeV]

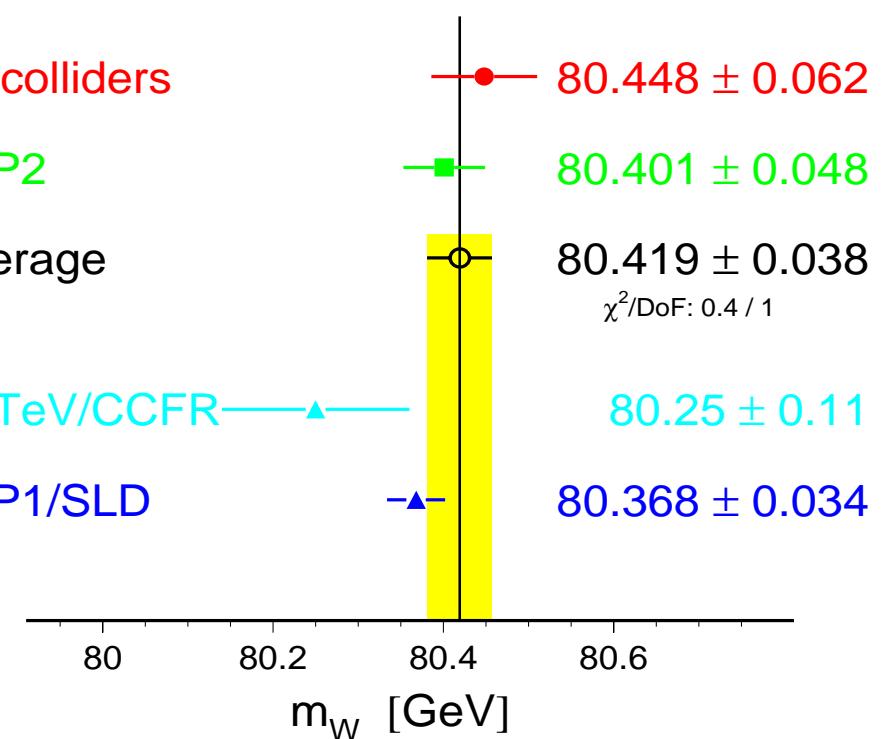

pp-colliders

LEP2

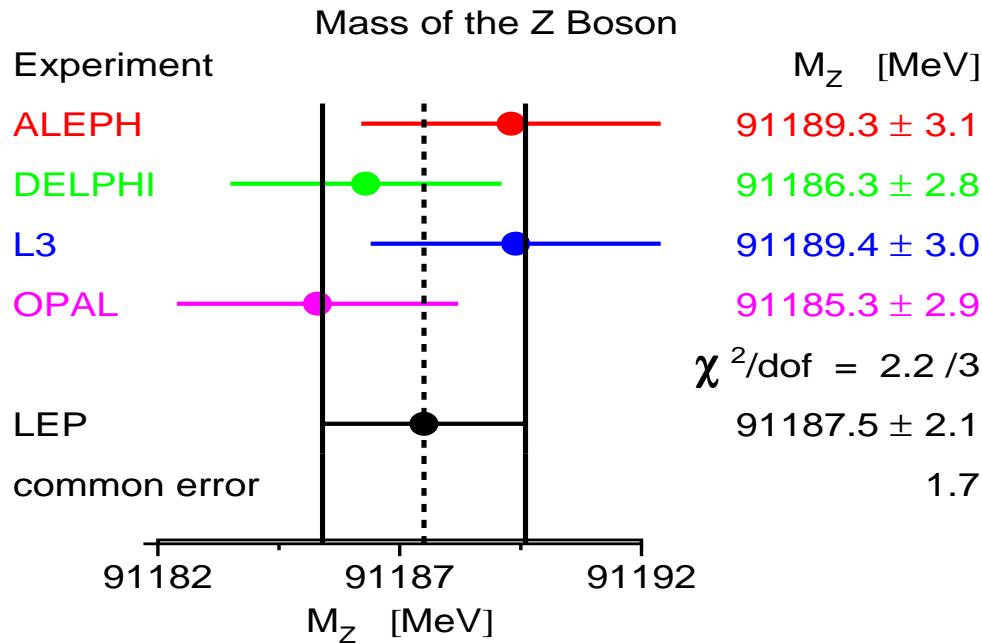

Average

NuTeV/CCFR

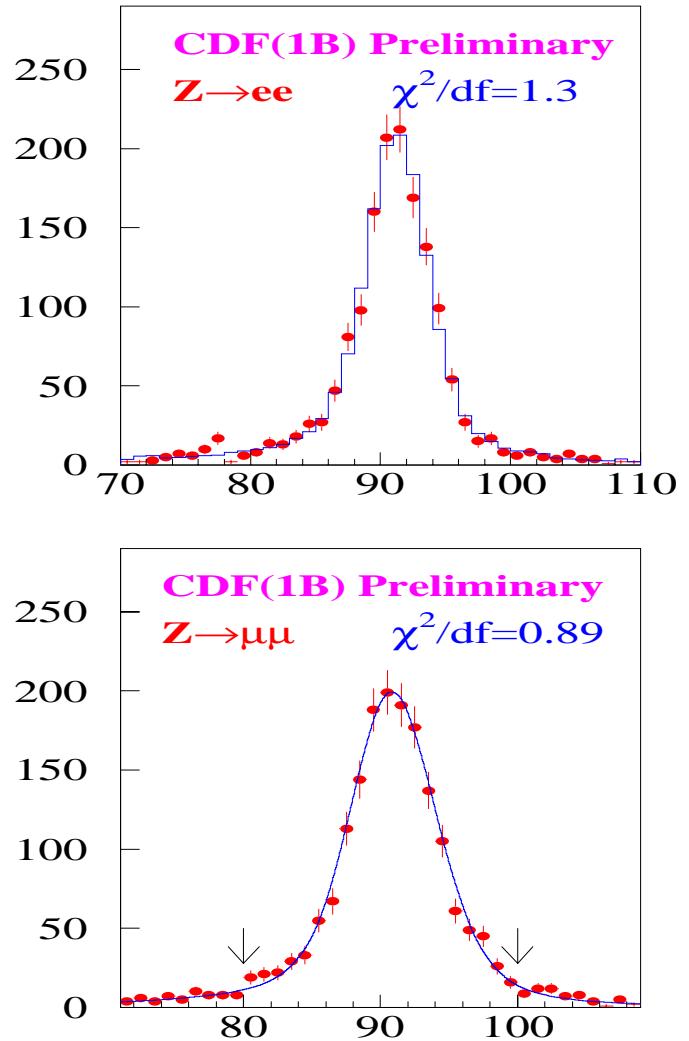

LEP1/SLD

# Z

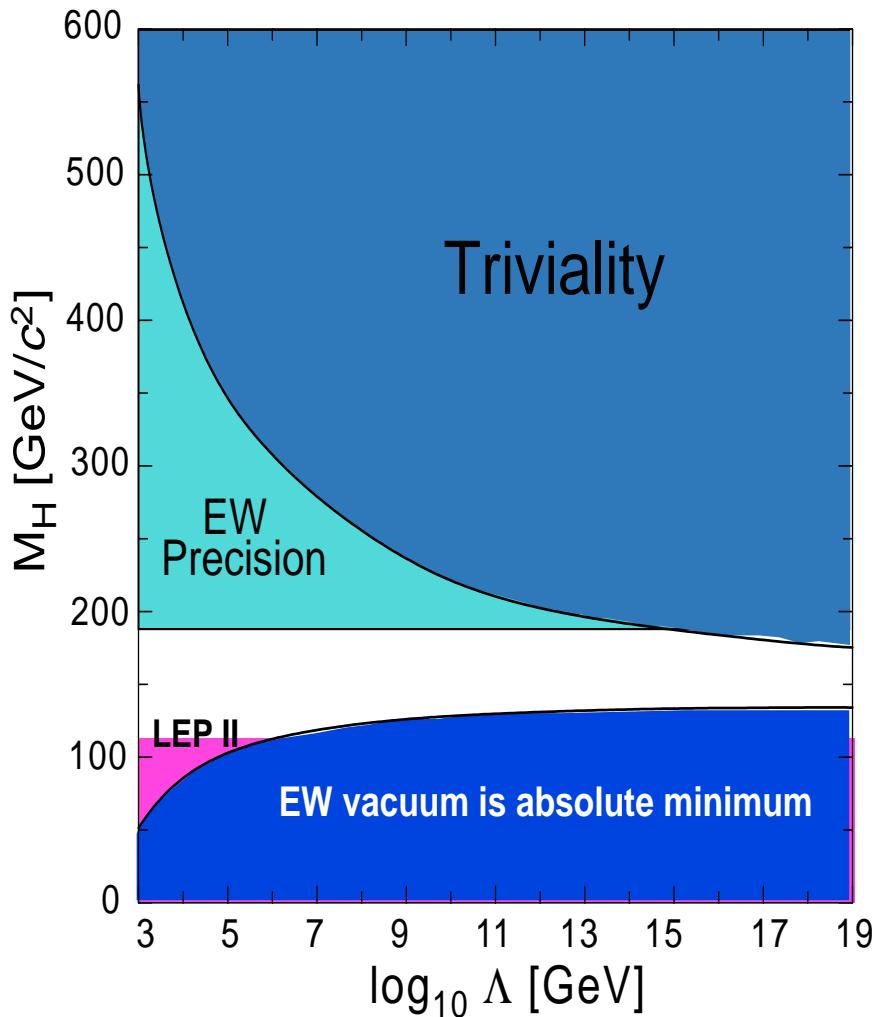

The W and Z were discovered by UA1 and UA2 at CERN

$$\begin{bmatrix} u \\ d \end{bmatrix} \begin{bmatrix} c \\ s \end{bmatrix} \begin{bmatrix} t \\ b \end{bmatrix} \text{High Energy Physics}$$

# SM Higgs Mass Bounds

- **Triviality:**
  - To avoid having the higgs self-coupling vanish, you need a cut-off  $\Lambda$  at which new physics occurs.
- **Vacuum stability:**
  - Require  $V(\phi_0) < V(0)$  - i.e. symmetry breaking takes place. For some masses this requires new physics above a scale  $\Lambda$ .
- **Fits to EWK Precision Measurements:**
  - $M_H < 188$  GeV at 95% CL
- **LEP II direct searches:**
  - $M_H \geq 114$  GeV at 95% CL

# Standard Model Flaws

---

- Problems
  - Hierarchy Problem: How did we get here when the only known fundamental scale is the Planck scale ( $M_p \sim 10^{19}$  GeV) ?
    - What is the underlying reason for EWK symmetry breaking and why at this low energy ?
  - Fermion and Higgs Masses ?
  - How do we include Gravity ?
  - Fundamental Scalar Theories are Fundamentally pathological
    - Quadratic divergences

# Beyond Standard Model

---

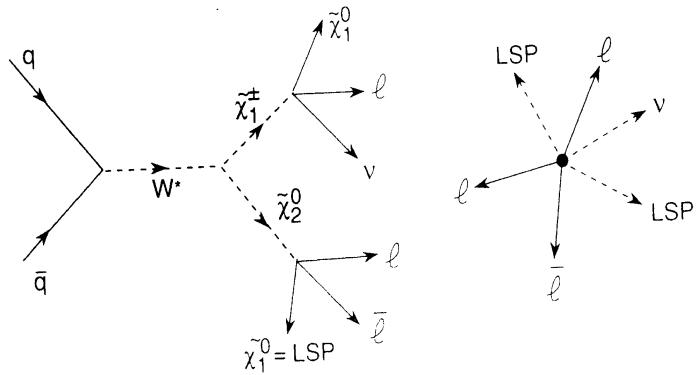

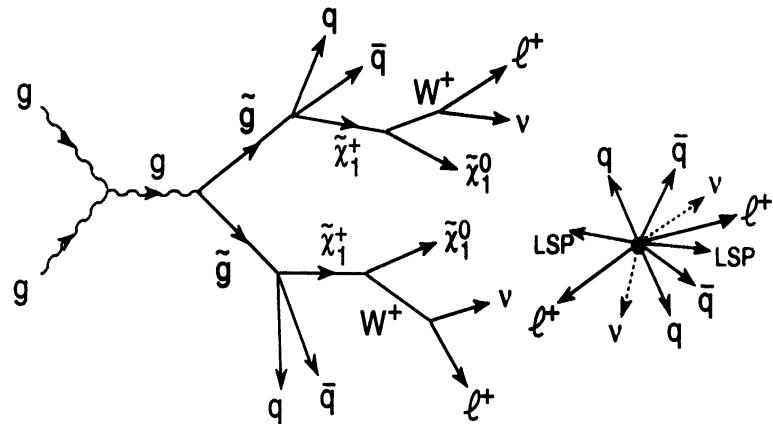

- Many other ways to break the symmetry
  - Fermion composite (cf. cooper pairs)
    - Technicolor → Topcolor-Assisted Walking Technicolor  
(a.k.a. " Stumbling drunk ...")
  - Supersymmetry (SUSY)
    - $\forall$  Standard Model particle  $\exists$  a SUSY partner with spin shifted by 1/2  
Fermions  $\leftrightarrow$  Bosons  
At least two Higgs doublets required
    - Appealing for several reasons
      - Superpartners cancel divergent terms in higher order corrections to the Higgs mass.
      - Formulated as a local symmetry, spin-2 graviton must be introduced
      - Appears in superstrings
      - Gauge coupling unification at  $\sim 10^{16}$  GeV if there are exactly 2 higgs doublets (and possibly some number of singlets)

# Supersymmetric Higgs

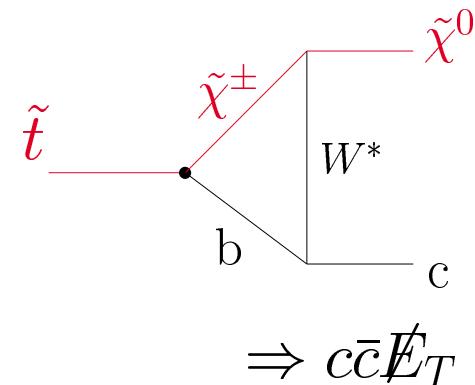

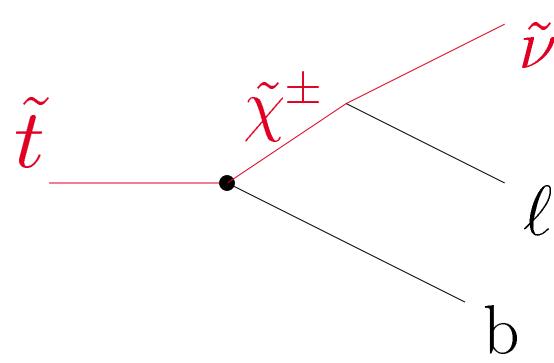

---

- Minimal Case of 2 doublets:
    - $\tan\beta = v_2/v_1$  and  $v_1^2 + v_2^2 = v^2$
    - After W,Z masses, 5 remaining d.o.f.
      - 5 physical higgs bosons  $h_0, H_0, A_0, H^\pm$
      - Scalar potential has one free parameter
        - masses are expressed in terms of  $m_A$  and  $\tan\beta$
    - Large radiative corrections (at one-loop)  
 $M_h^2 < M_Z^2 + (3G_F/(2^{1/2}\pi^2)) M_t^4 \ln(1+m^2/M_t^2)$   
 $M_h < 130 \text{ GeV}$   
 $< 150 \text{ GeV (w/Higgs singlets)}$
    - Some Important features
      - Couplings to W,Z now shared
- $g_{h_0}vv^2 + g_{H_0}vv^2 = g_{H}vv^2 \text{ (SM)}$

# Feynmann Diagrams for SUSY

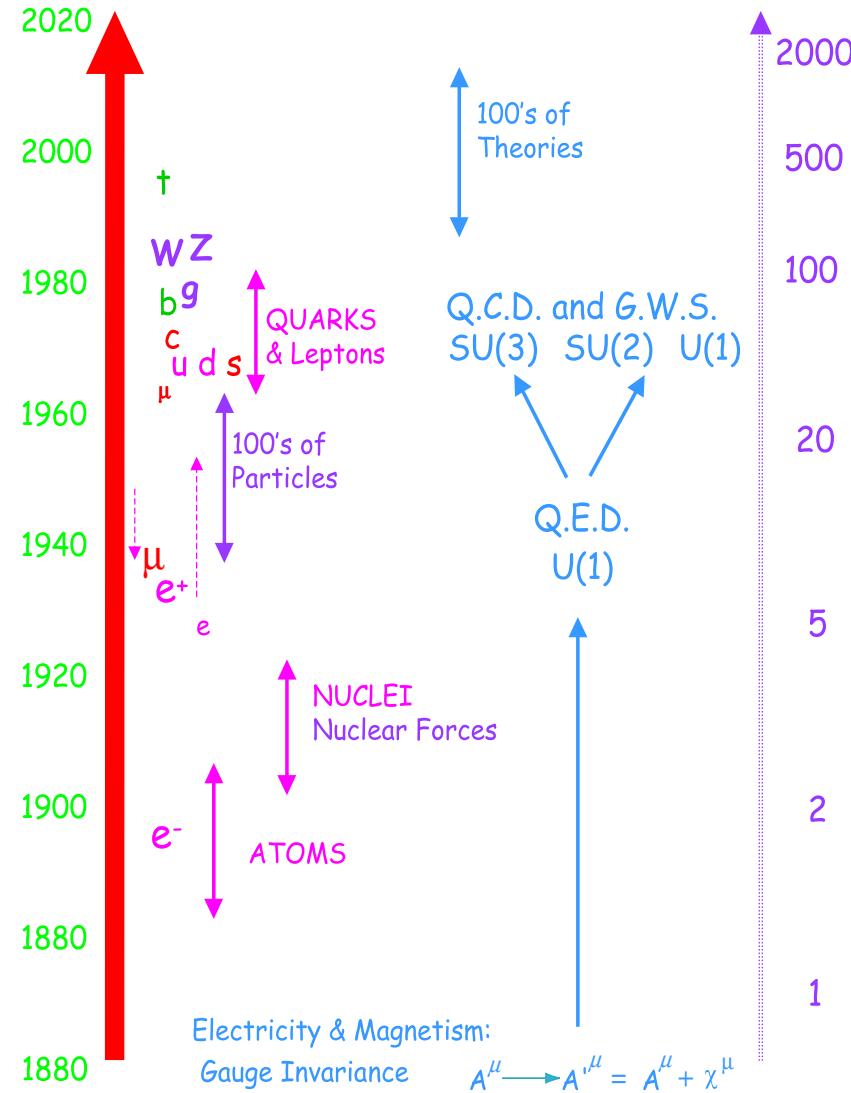

gluino pair production w/ cascade to like sign di-leptons or gauginos to tri-leptons

stop pair production to top-like decays with bottom or cascades to charm

# History of particle physics

- Parallel experimental and theoretical developments
  - Discovery of several layers of fundamental particles
  - Realization of the importance of Gauge symmetries

*And some accidental symmetries...*

# Experimental focus today

---

- Some Questions at the leading edge where UCSB hopes to help shed some light...
  - Why is the universe predominantly matter?
    - What is and what causes CP violation ?
  - What is the composition of galactic dark matter ?
    - Weak scale SUSY ?
  - Why do particles have mass ?
    - (I.e. what is the origin spontaneous symmetry breaking ?)
  - What is there beyond the standard model ?
    - Is the universe super symmetric ?

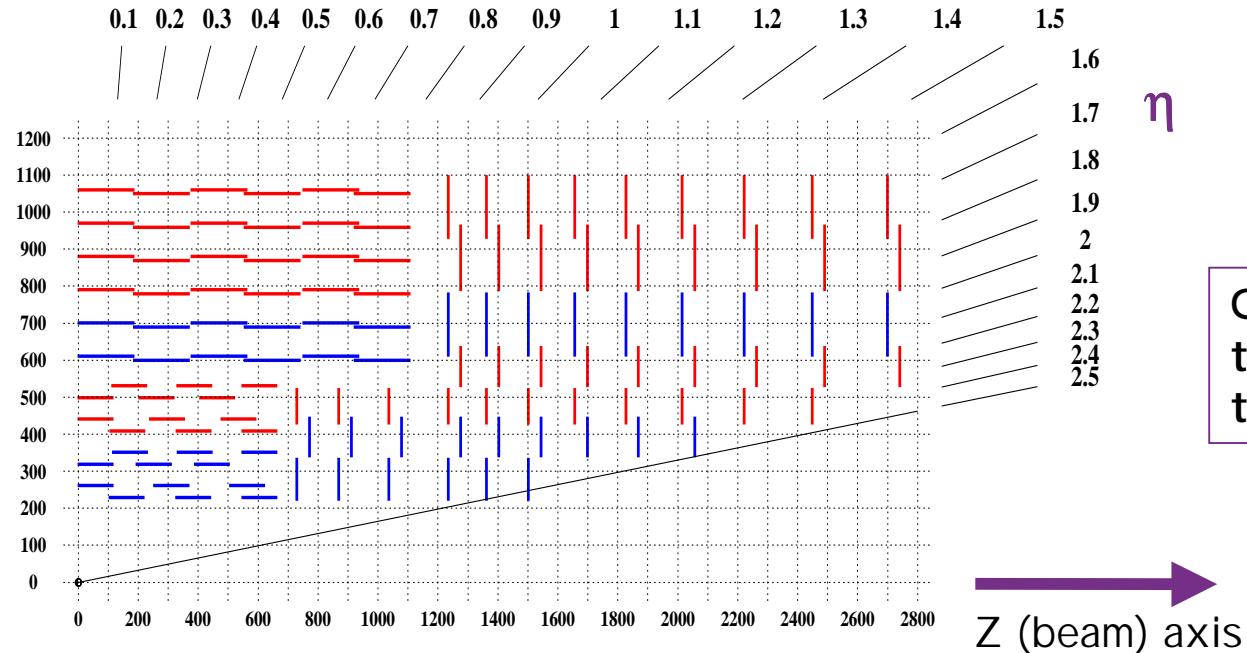

# Outline

---

- Hadron Colliders (*Campagnari, Incandela, Stuart*)
    - Some Basics
    - History
    - CDF Experiment at the Tevatron
    - CMS Experiment at LHC
  - Cold Dark Matter Search (*Caldwell, Nelson*)
    - The common thread
    - Listening out for WIMPs
  - Babar Experiment at SLAC\* (*Campagnari, Richman*)
    - Rare b decays and CP violation
- \*(covered in Tuesday's colloquium)

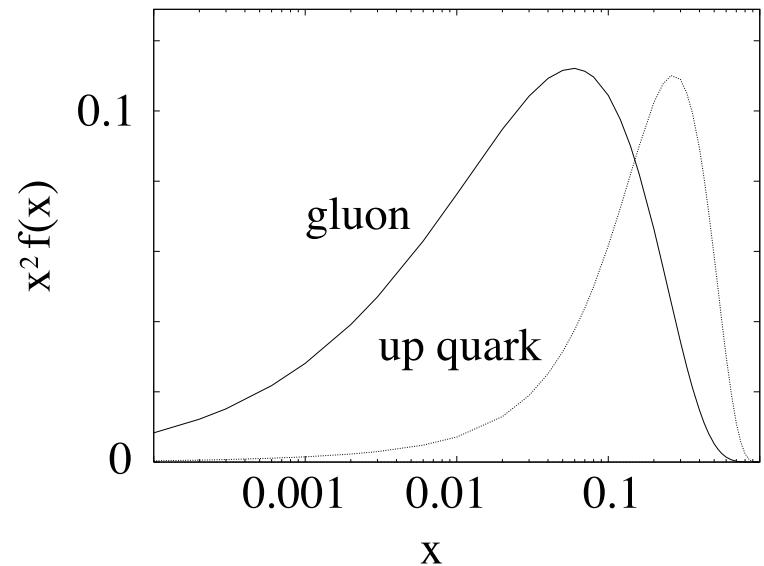

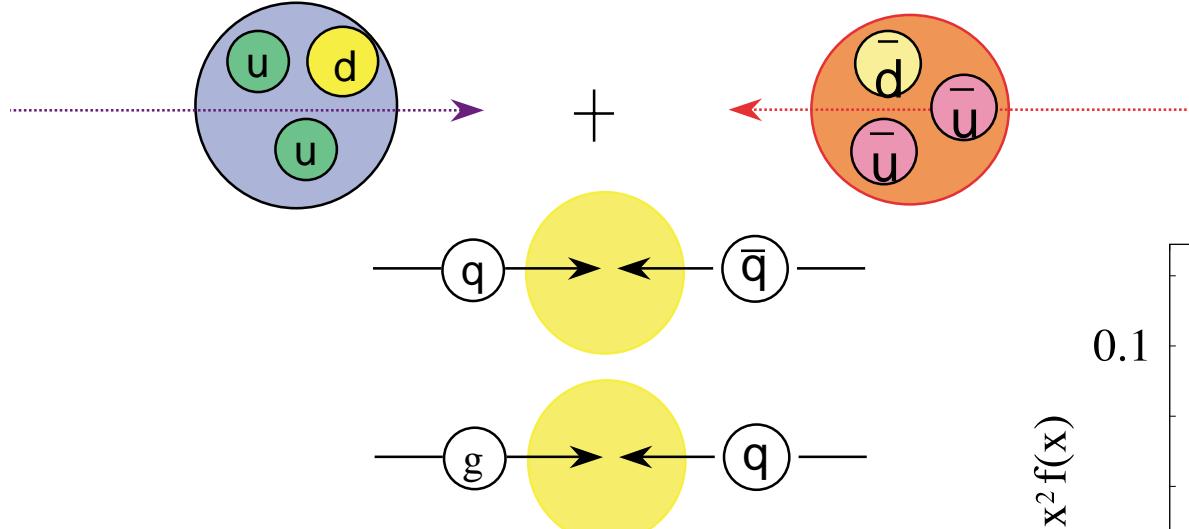

# Hadron Collider Jargon:PDF's, $P_T$ , and $\eta$

- Really colliding 'partons':**qg, qq, gg**
  - q can be a valence (u,d) or a sea (virtual) quark (...s,c,b...).
- Momenta given by Parton Distribution Functions (PDF's)
  - ⇒ Can't balance all components
    - $P_T \equiv$  Transverse Momentum must balance.
    - $P_z \equiv$  Longitudinal Momentum (along the beam) unknown.
  - Coordinates  $(r, \eta, \phi)$  with  $\eta = -\ln(\tan(\theta/2))$
  - Distributions  $(dN/d\eta)$  invariant under boosts in z

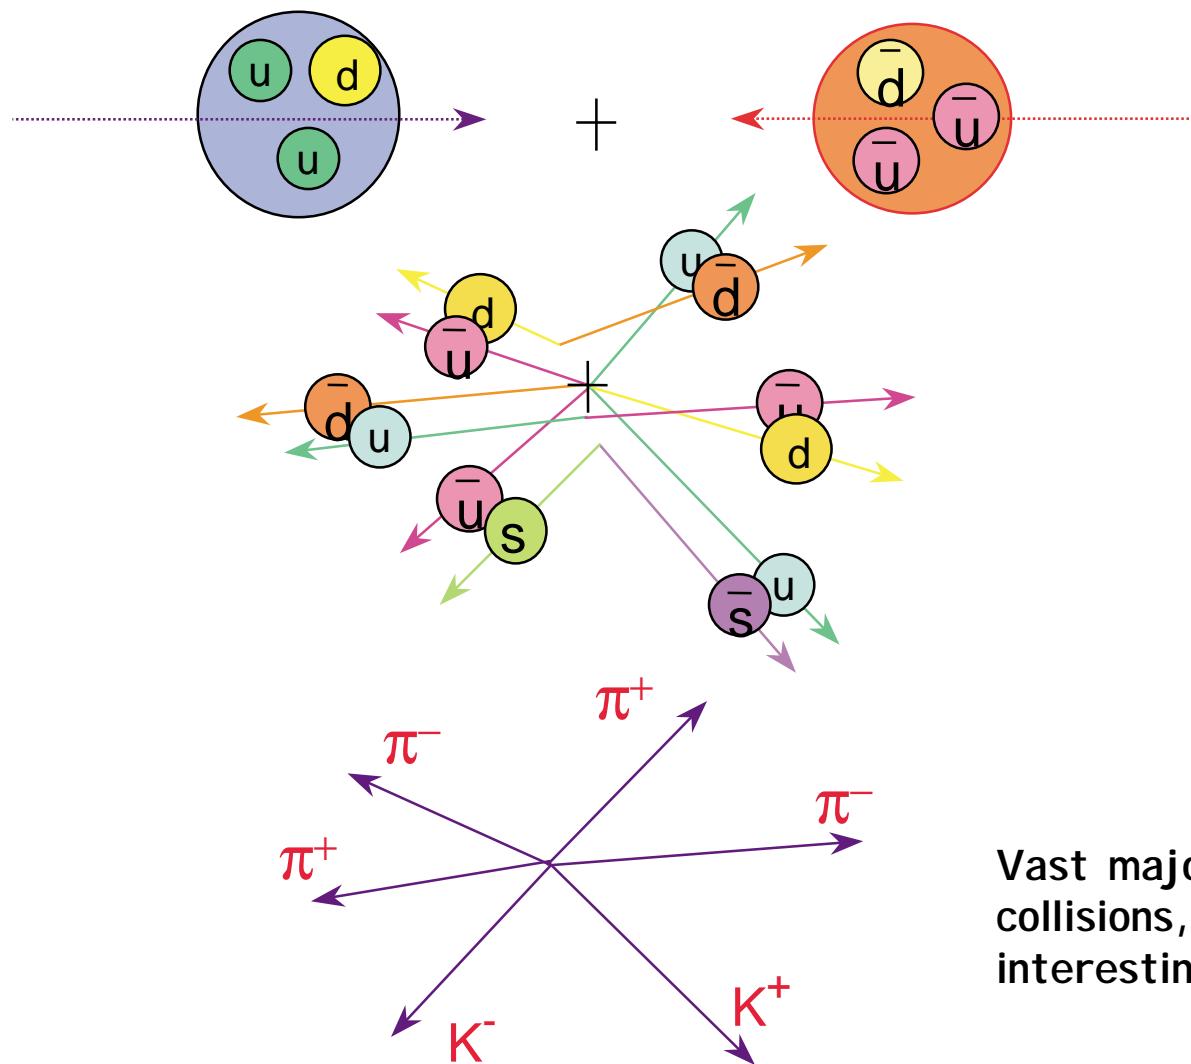

Quadrant of  
the CMS silicon  
tracker

# Colliding Partons

⇒Broadband: Production of particle states  
with cm energies ranging from a few to 100's of GeV

# “Minimum Bias” Events

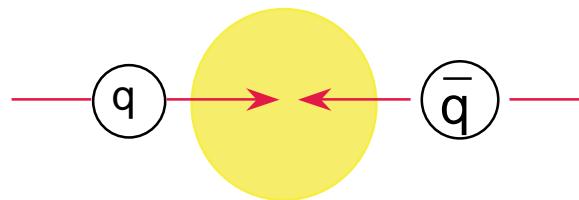

Vast majority of  
collisions, but not  
interesting...

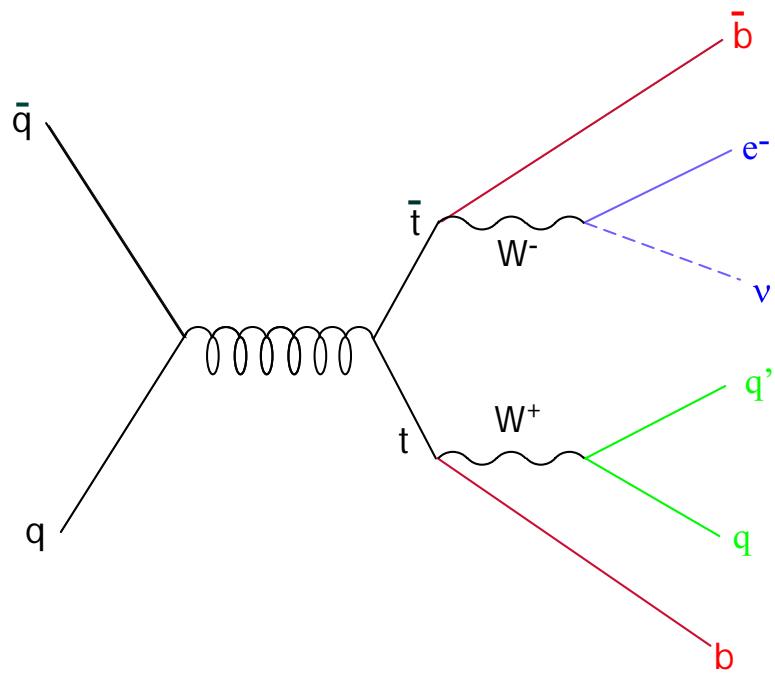

$$\begin{bmatrix} u \\ d \end{bmatrix} \begin{bmatrix} c \\ s \end{bmatrix} \begin{bmatrix} t \\ b \end{bmatrix}$$

High Energy Physics

# Hard Collisions

Quark-Antiquark  
Annihilation

Example: top quark pair  
production

# FNAL and CERN

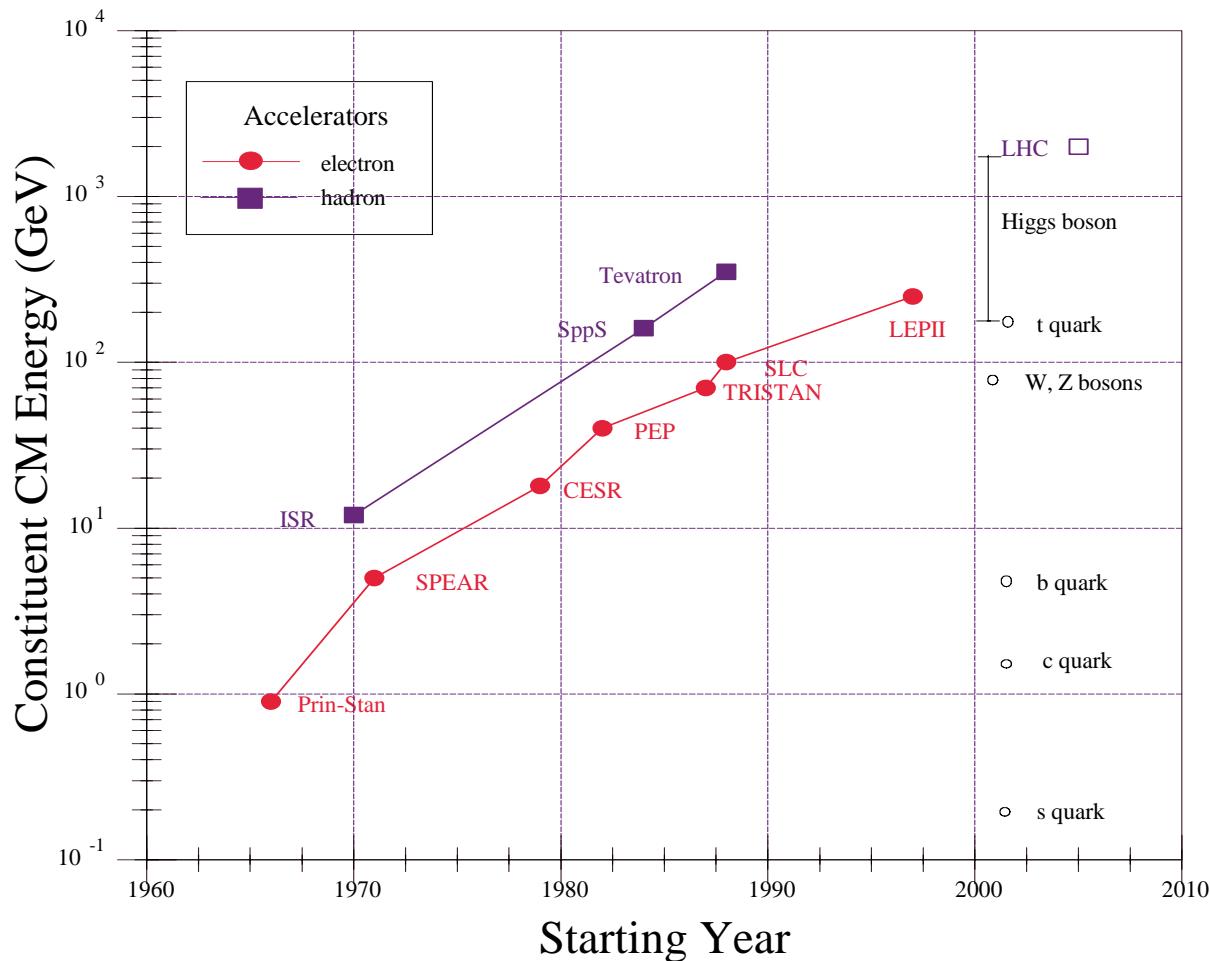

---

$$\begin{bmatrix} u \\ d \end{bmatrix} \begin{bmatrix} c \\ s \end{bmatrix} \begin{bmatrix} t \\ b \end{bmatrix}$$

High Energy Physics

# Why Collide Hadrons ?

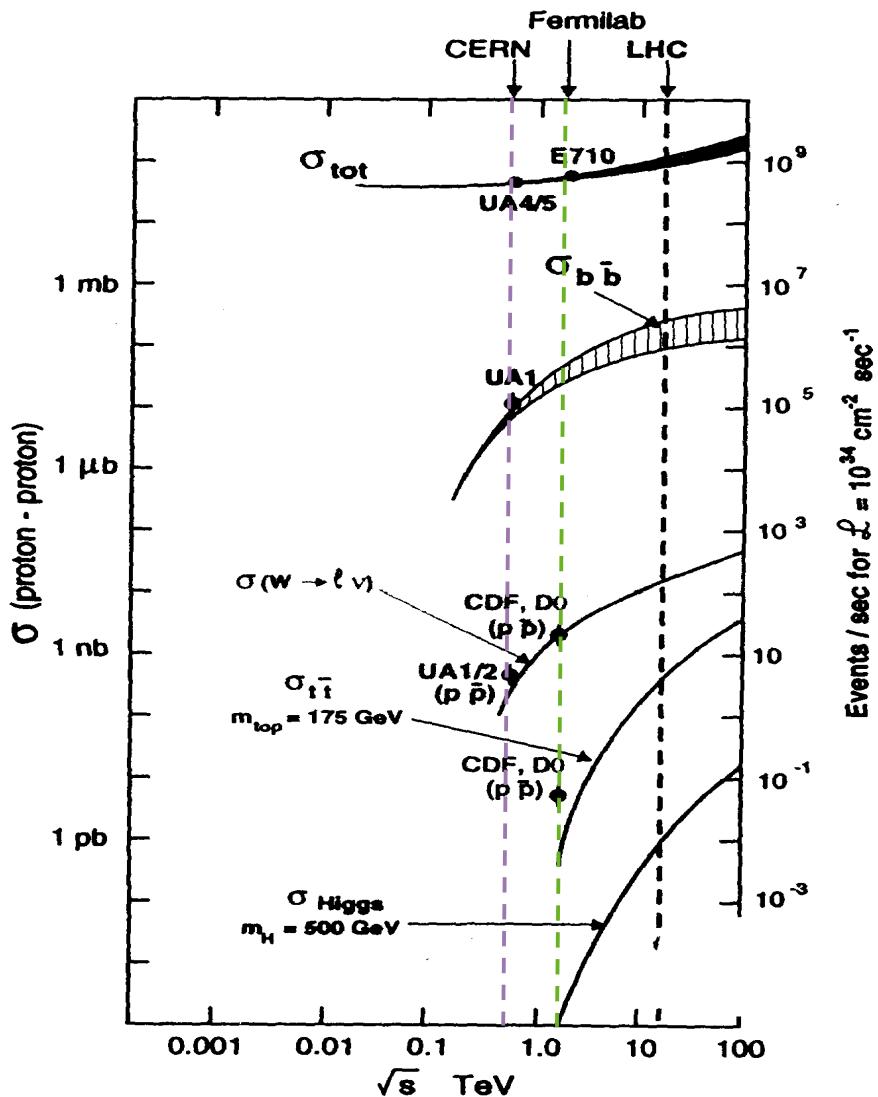

# Challenge and Reward

- Higher Energy
- Broadband production

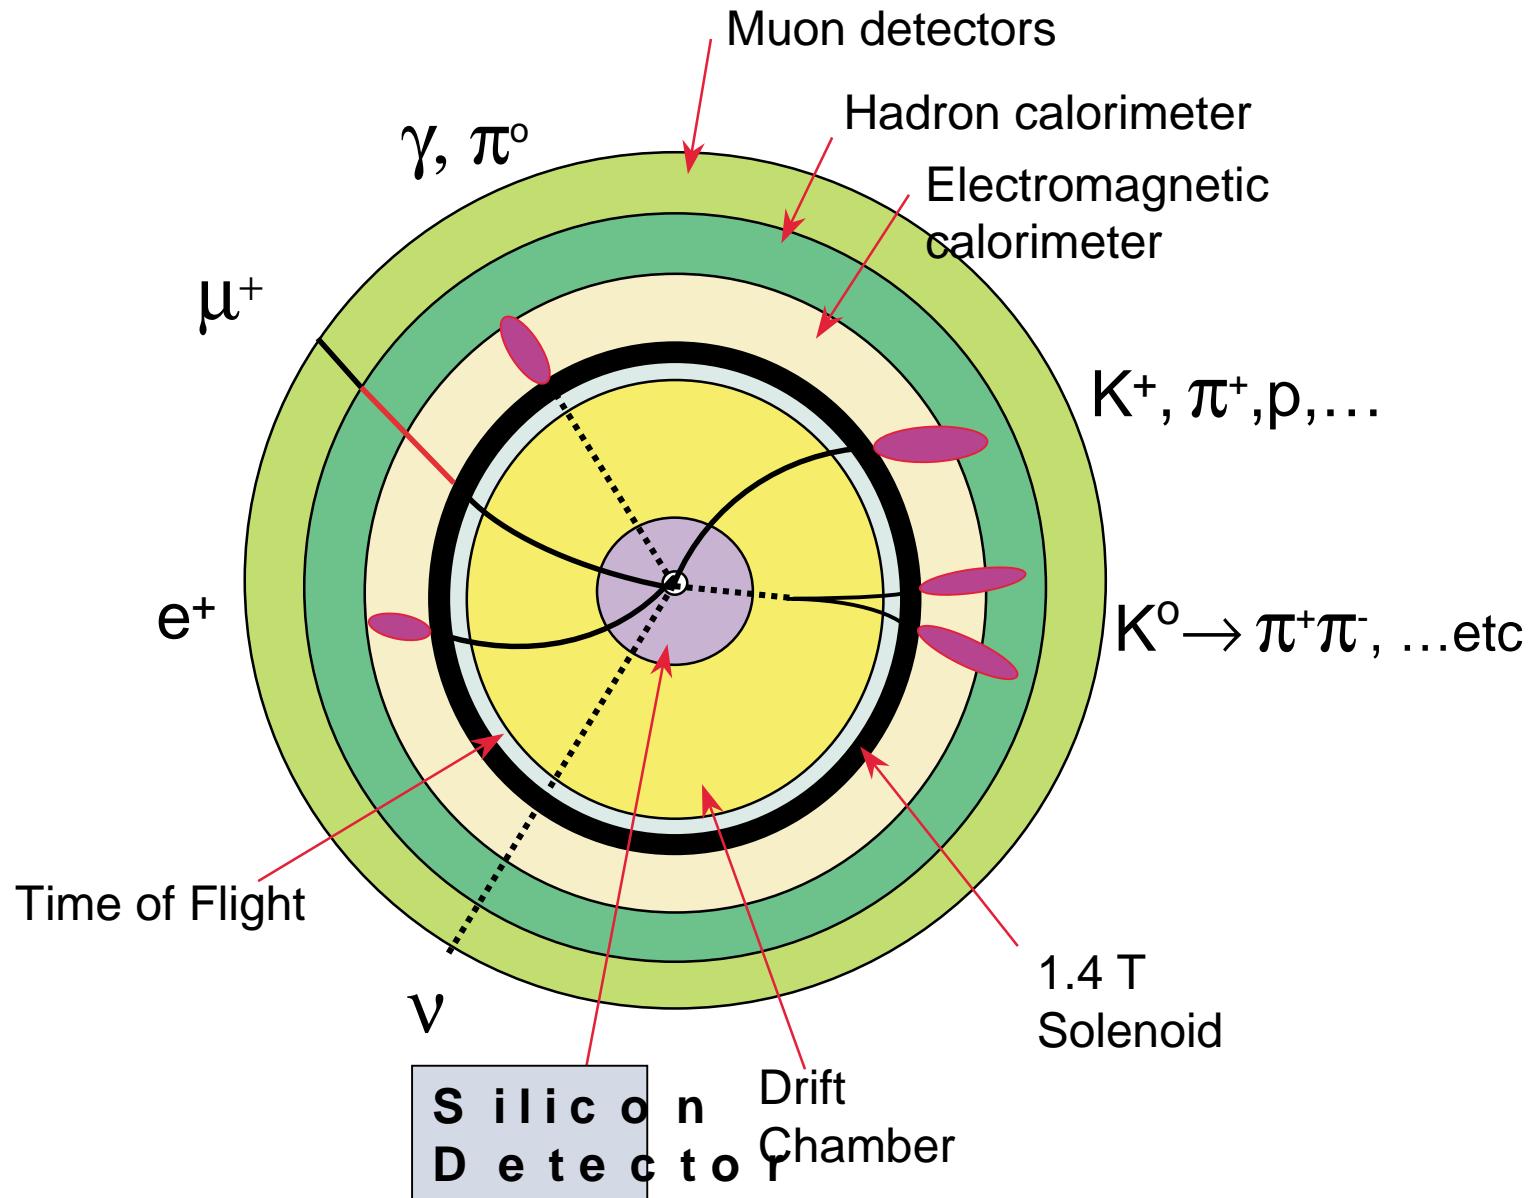

## ⇒ Discovery machines

- Physics cross-section high
- What's interesting is rare
- The ability to find rare events is a consequence of evolved detector design and technological innovations
  - Multi-level trigger systems and high speed pipe-lined electronics
  - Precision, high rate, calorimetry
  - High rate wire tracking detectors
  - Highly radiation-tolerant Silicon microstrip and Pixel detectors

$$\begin{bmatrix} u \\ d \end{bmatrix} \begin{bmatrix} c \\ s \end{bmatrix} \begin{bmatrix} t \\ b \end{bmatrix} \text{High Energy Physics}$$

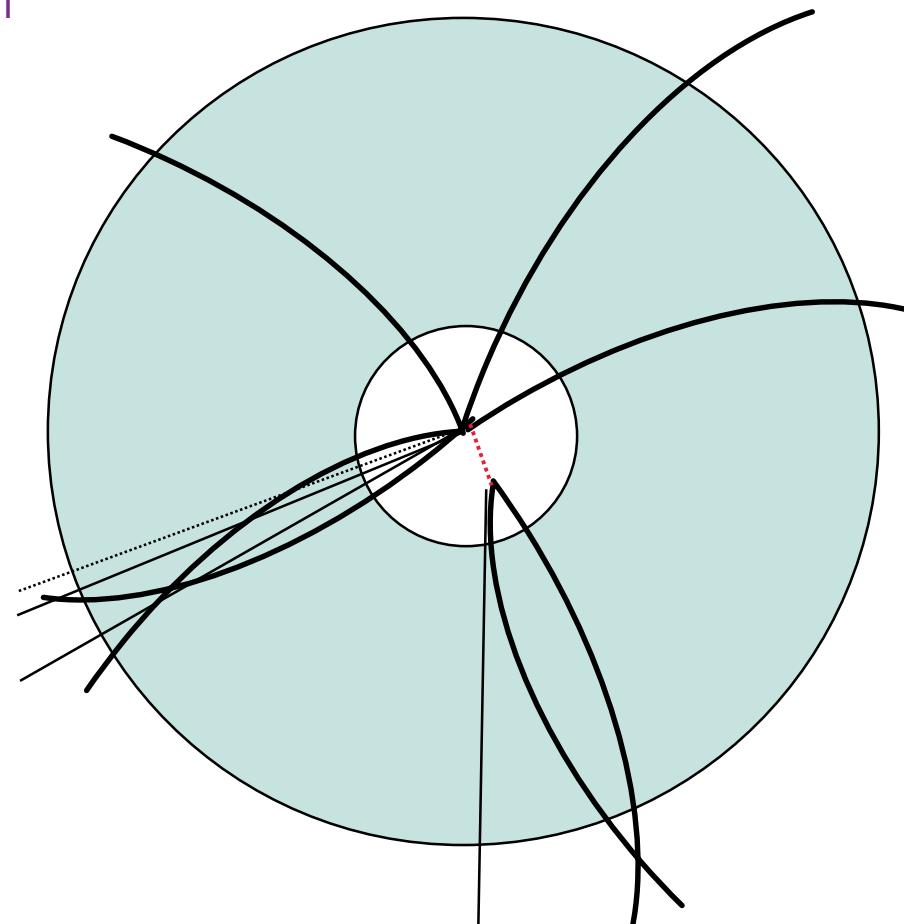

# Hadron Collider Detectors

# Micro-Vertexing

First operation of a Silicon detector first in a hadron collider: May 12, 1992.

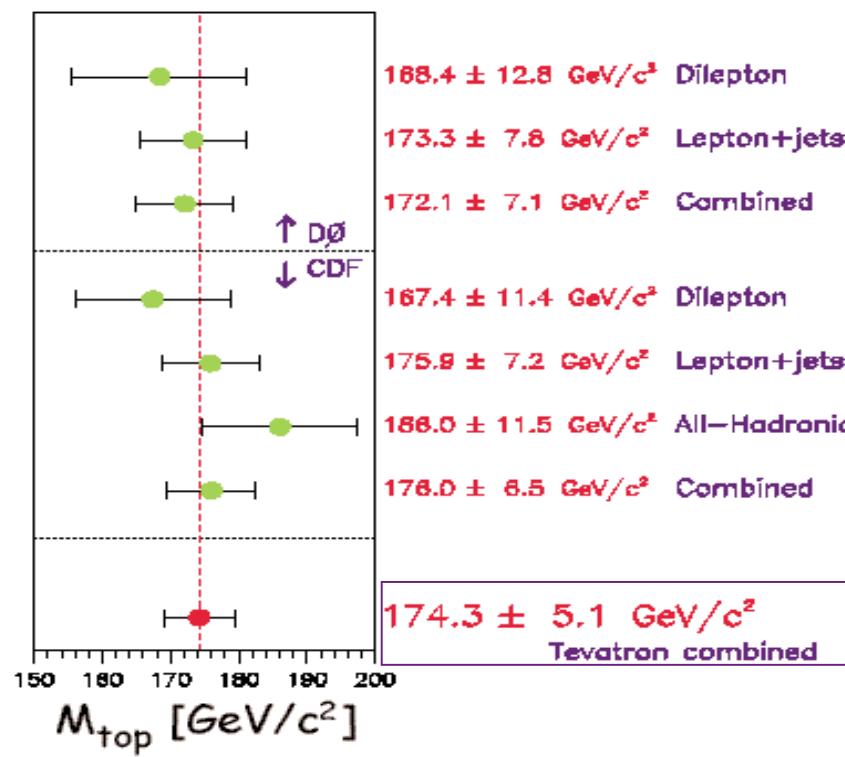

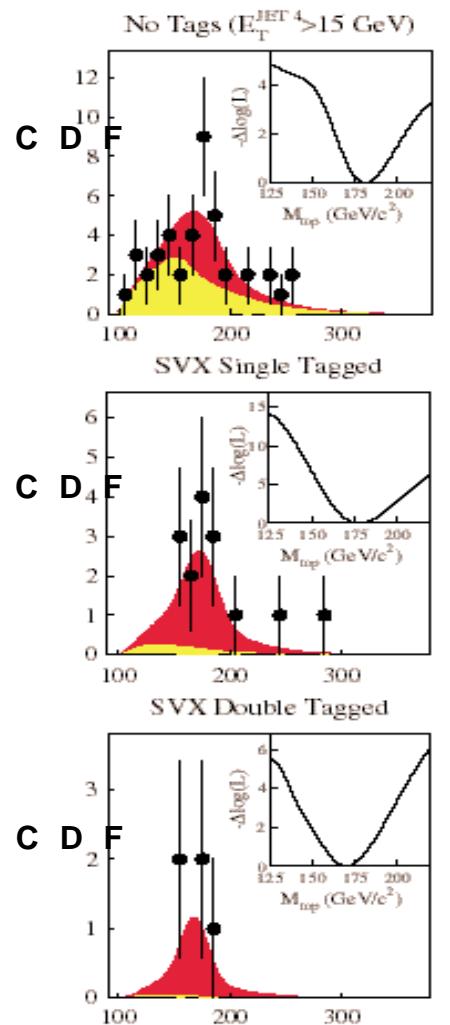

Generic (u,d,s) jet

b,c,τ jet

# Tevatron: Top Discovery

## Displaced Vertex b tagging

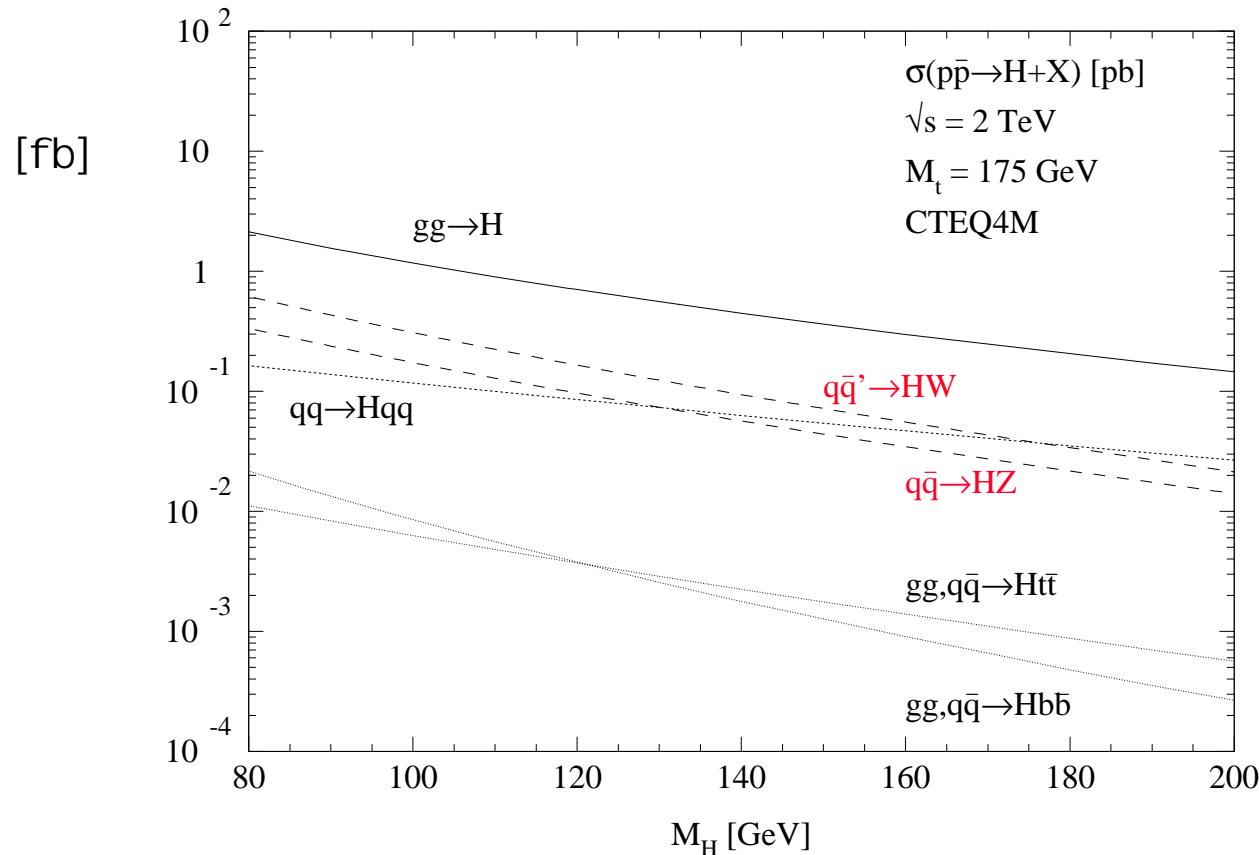

- CDF and DØ successfully found the top quark with a cross section of  $\sim 10^{-10} \sigma_{\text{tot}}$

# What's Next ?

---

- Hadron Colliders have 2 main goals.
  1. Find the Higgs
  2. Direct evidence of something beyond the standard Model  
e.g. SUSY partners
- Plus... more work on the Standard Model:
  - Precision electroweak measurements
    - $M_W$ ,  $M_{top}$
  - B Physics
    - CKM and CP Violation
    - $B_s$  mixing
- ... as well as more exotic fare...
  - Large extra dimensions
  - Mini-black holes (Giddings UCSB)

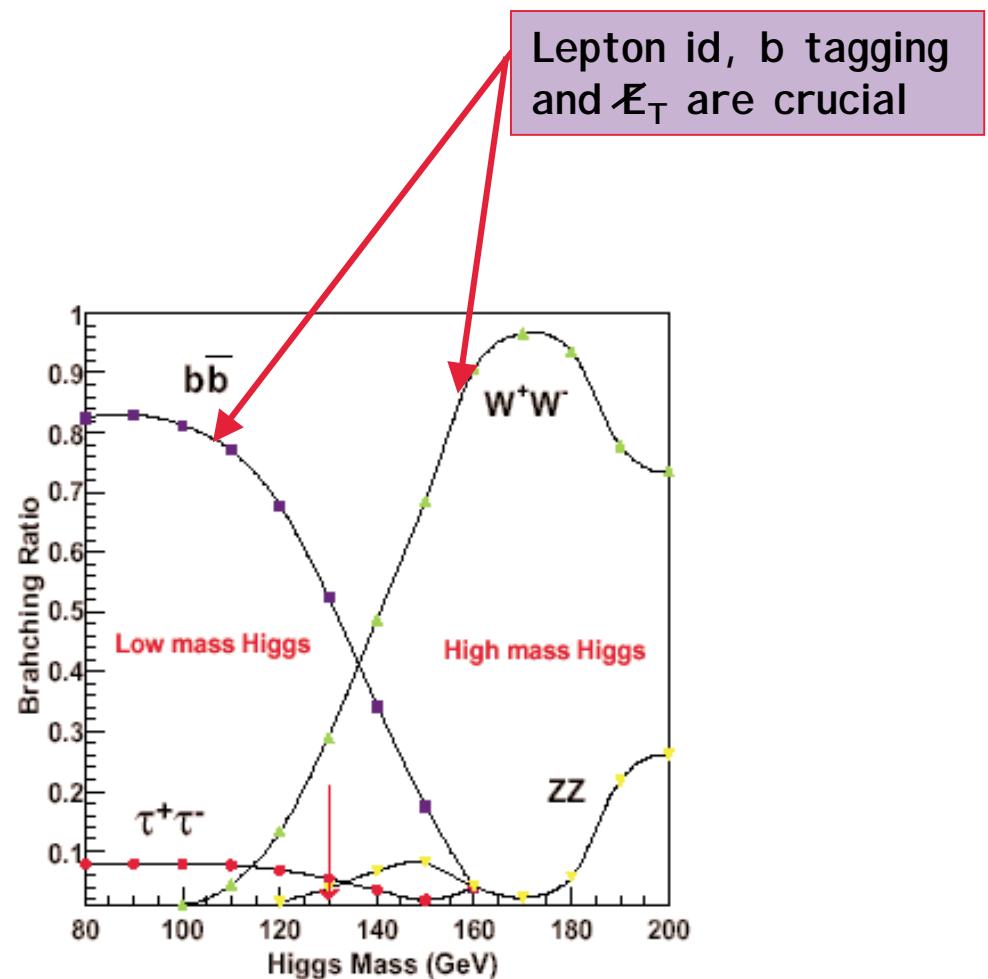

# Tevatron: SM Higgs Production

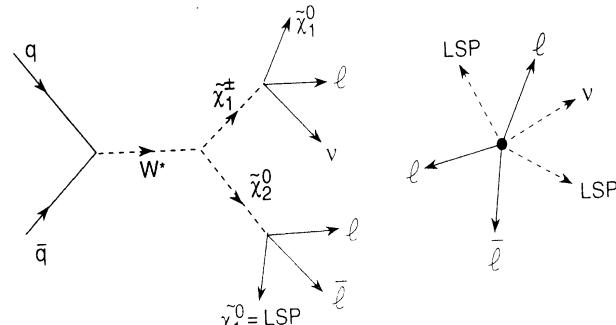

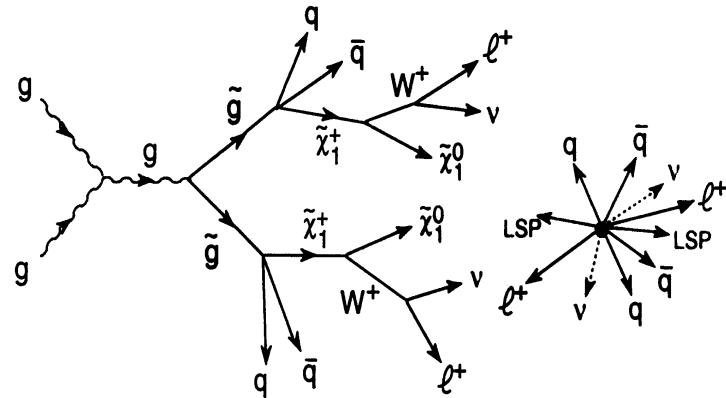

- $gg \rightarrow H$  dominates but swamped by dijets
- $qq' \rightarrow HV$  factor 5-10 lower but backgrounds are more rare ( $t\bar{t}, Wbb, Zbb, WZ$ )

# Tevatron: SM Higgs Decays

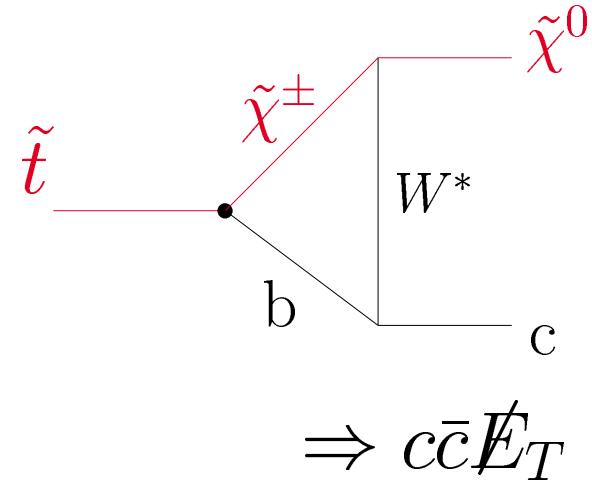

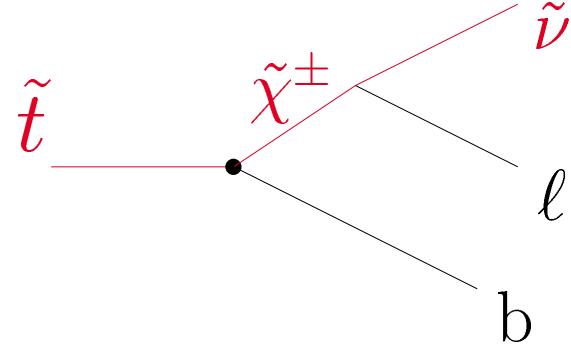

- $m_H < 130$ :  $H \rightarrow b\bar{b}$   
dominant:  
 $\Rightarrow W(l\nu, q\bar{q}) b\bar{b}, Z(v\bar{v}, l\bar{l}, q\bar{q}) b\bar{b}$   
final states
- $m_H > 140$ :  $H \rightarrow WW$   
dominant:  
 $\Rightarrow W^+W^-, W^+W^-W^\pm, W^+W^-Z :$   
 $l^+l^-vv, l^+l'^+vvjj, l^+l^-l'^\pm$   
final states
- MSSM Higgs: many of  
the same channels as  
SM and enhanced  
association to  $b\bar{b}$  at  
large  $\tan\beta$

# SUSY

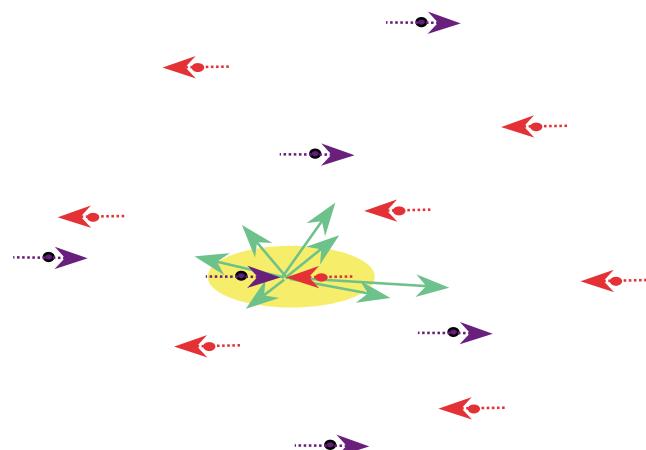

gluino pair production w/ cascade to like sign di-leptons or gauginos to tri-leptons

stop pair production to top-like decays with bottom or cascades to charm

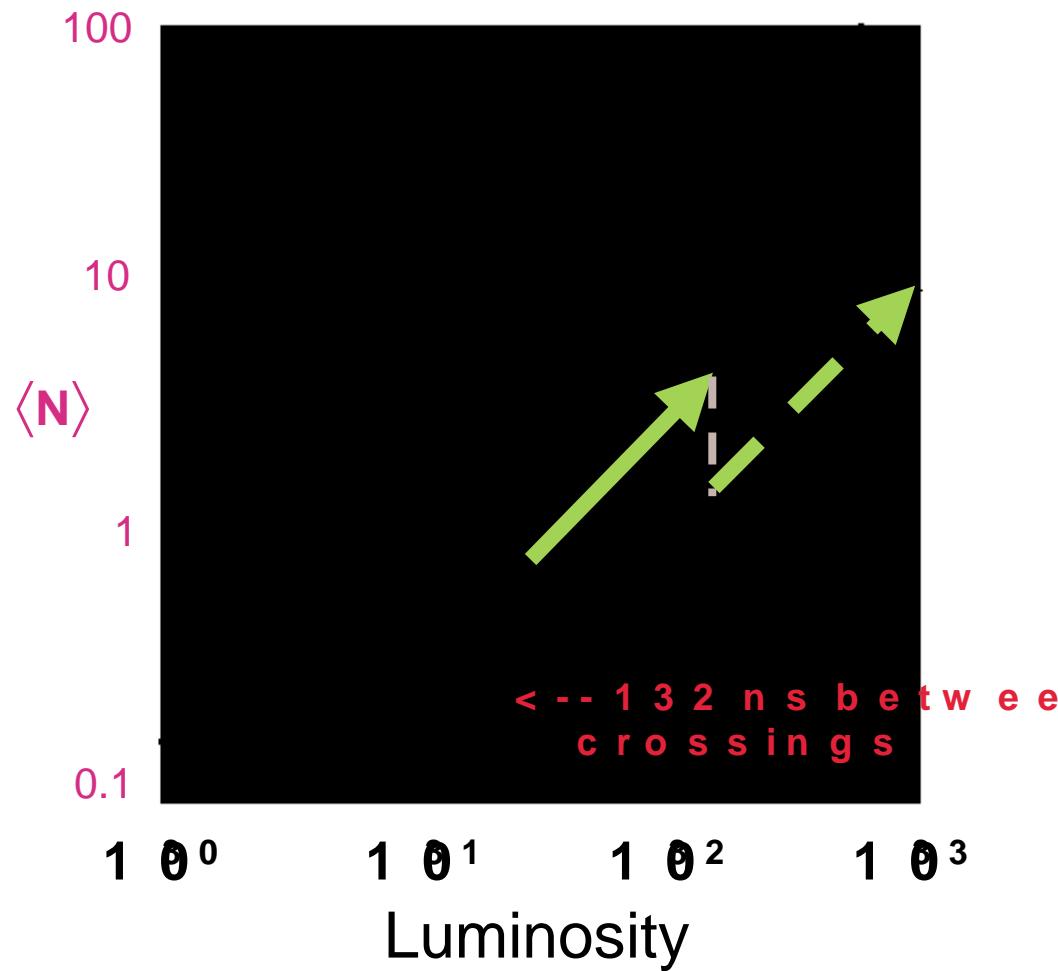

# Colliding Beams

- FNAL Tevatron  
 $R = 1 \text{ km}$ ,  $E_{\text{beam}} = 1 \text{ TeV}$ ,  $B = 4.5 \text{ Tesla}$
- Bunch structure:
  - 36 x 36 will be 141 x 121 bunches
    - $\sim 10^{11}$  ( $10^9$ ) p (pbar) per bunch
    - Interaction rate is  $\sim 7 \text{ MHz}$   
(beams collide every 132 ns)
  - Goal: A high beam-beam crossing rate but with  $\langle N \rangle \sim 1$  collision per crossing (expect 1 – 10)

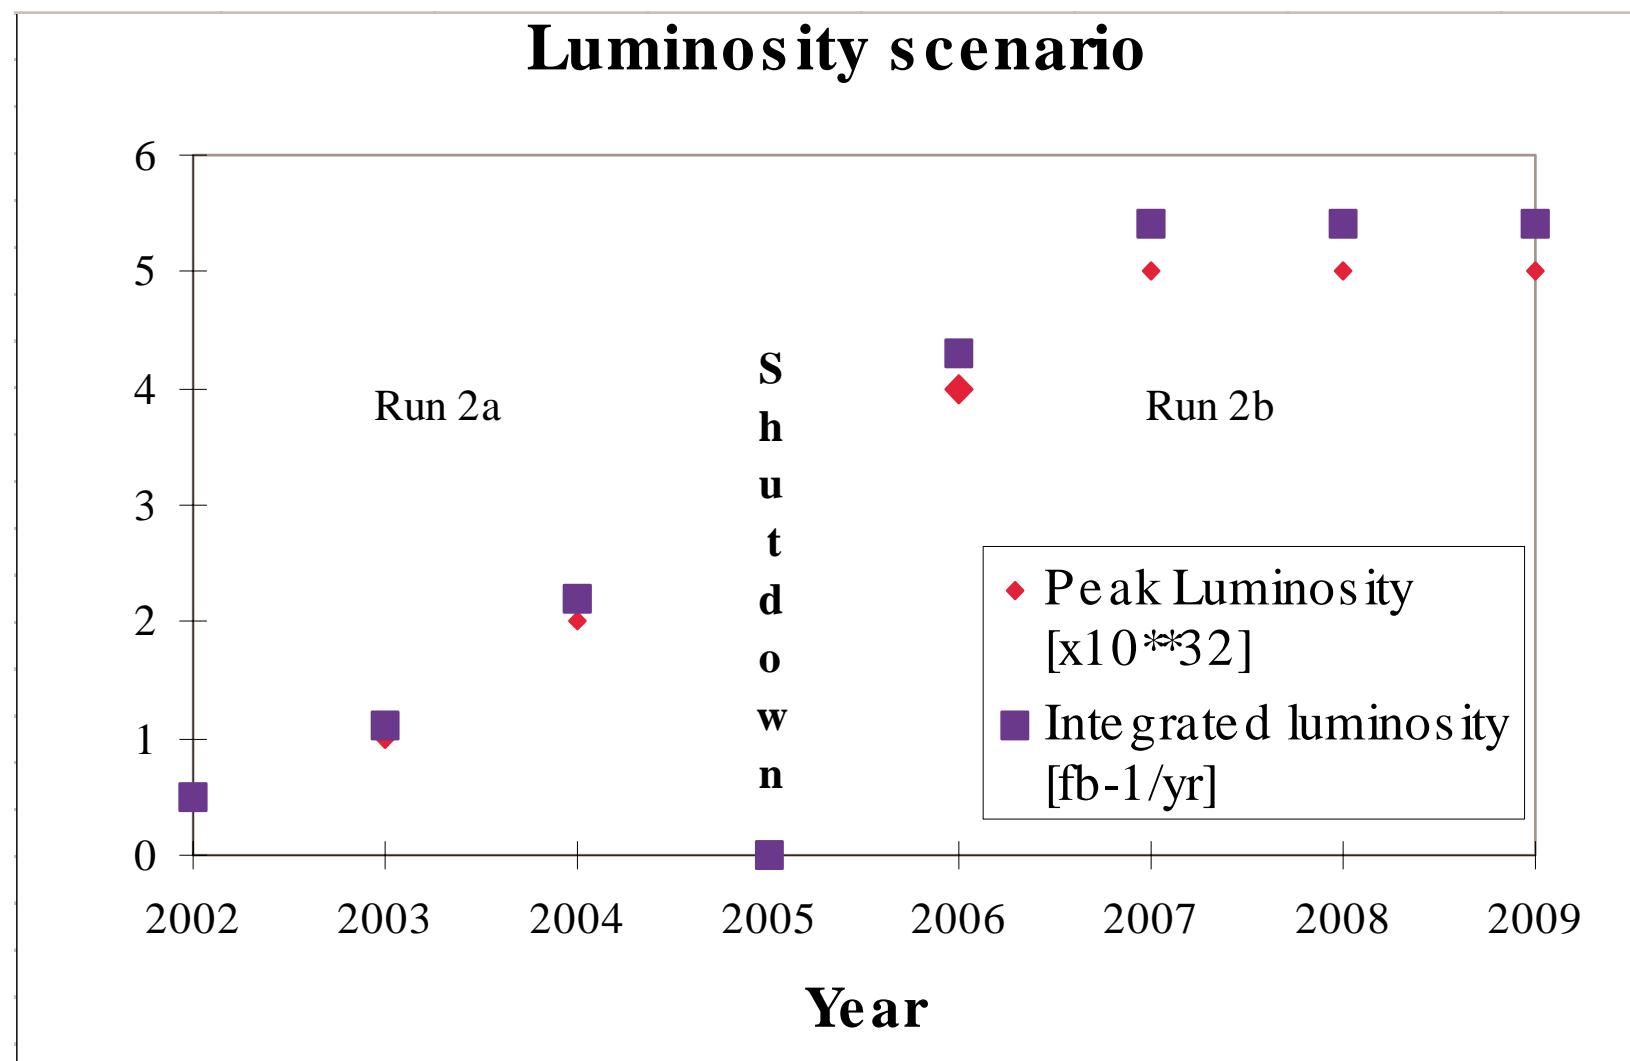

$$\begin{bmatrix} u \\ d \end{bmatrix} \begin{bmatrix} c \\ s \end{bmatrix} \begin{bmatrix} t \\ b \end{bmatrix}$$

High Energy Physics

# Luminosity Profile\*

\* Likely to change once we have more operational experience.

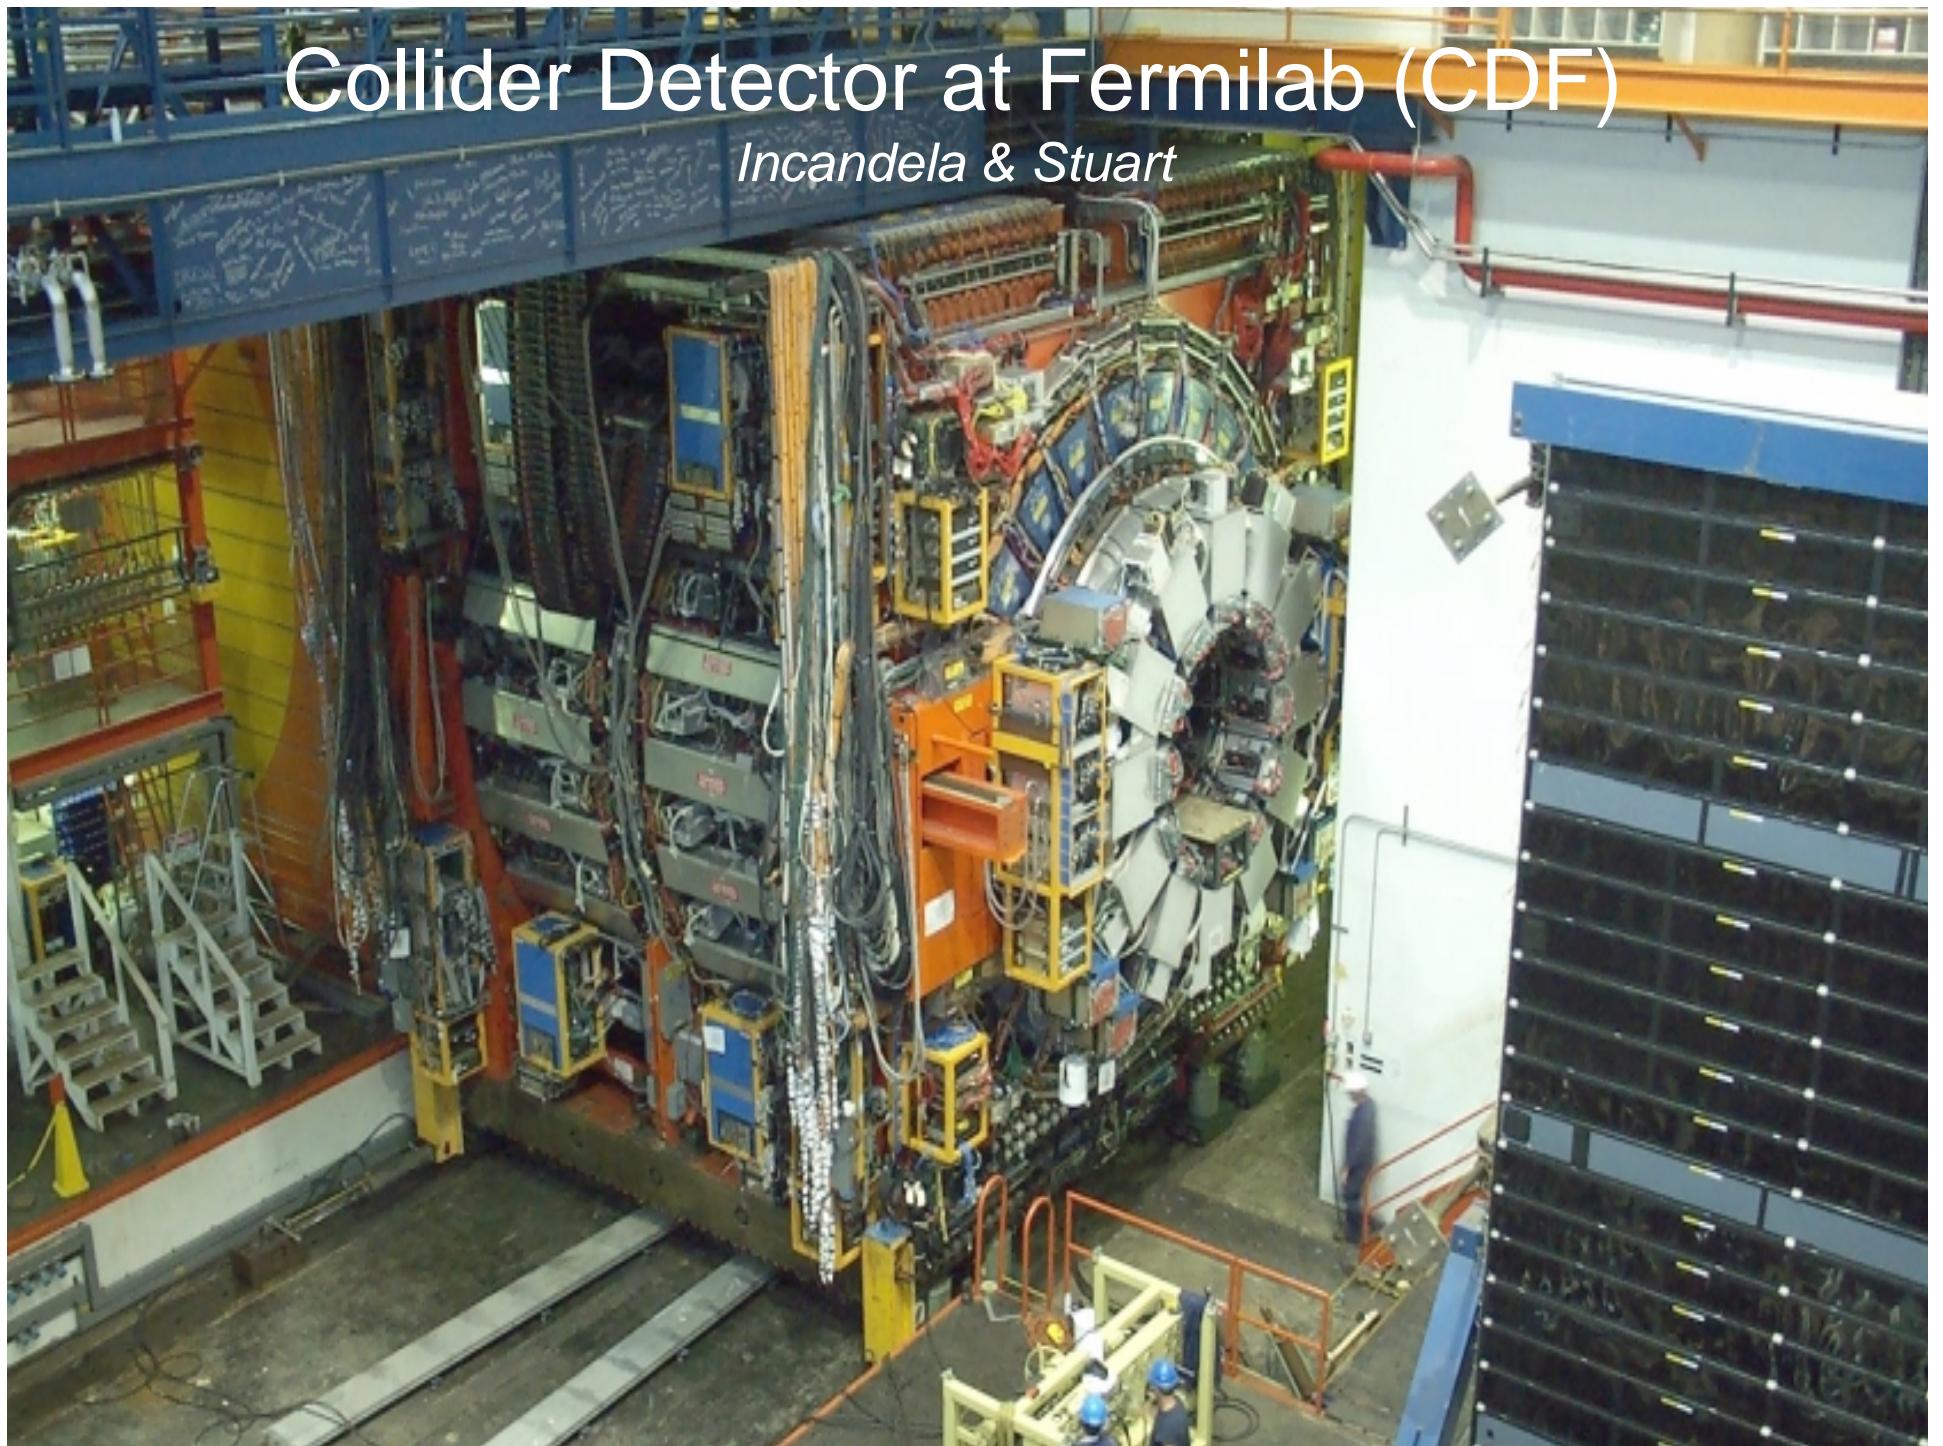

# Some Numbers

---

- Collisions are frequent (~ 7 million per second) but interesting collisions are rare.
  - $10^{12}$  collisions allowed us to observe ~ 50 top quark events
- We can only write ~50 events to tape per second.
  - Three decision ('trigger') levels:
    - A first analysis is done in ~4  $\mu\text{s}$
    - A second quick analysis takes ~ 20  $\mu\text{s}$
    - The third and final analysis takes ~ 0.1 second
- We collect 1 Terabyte of data per day and our total data set will be ~10 Petabytes

High Energy Physics

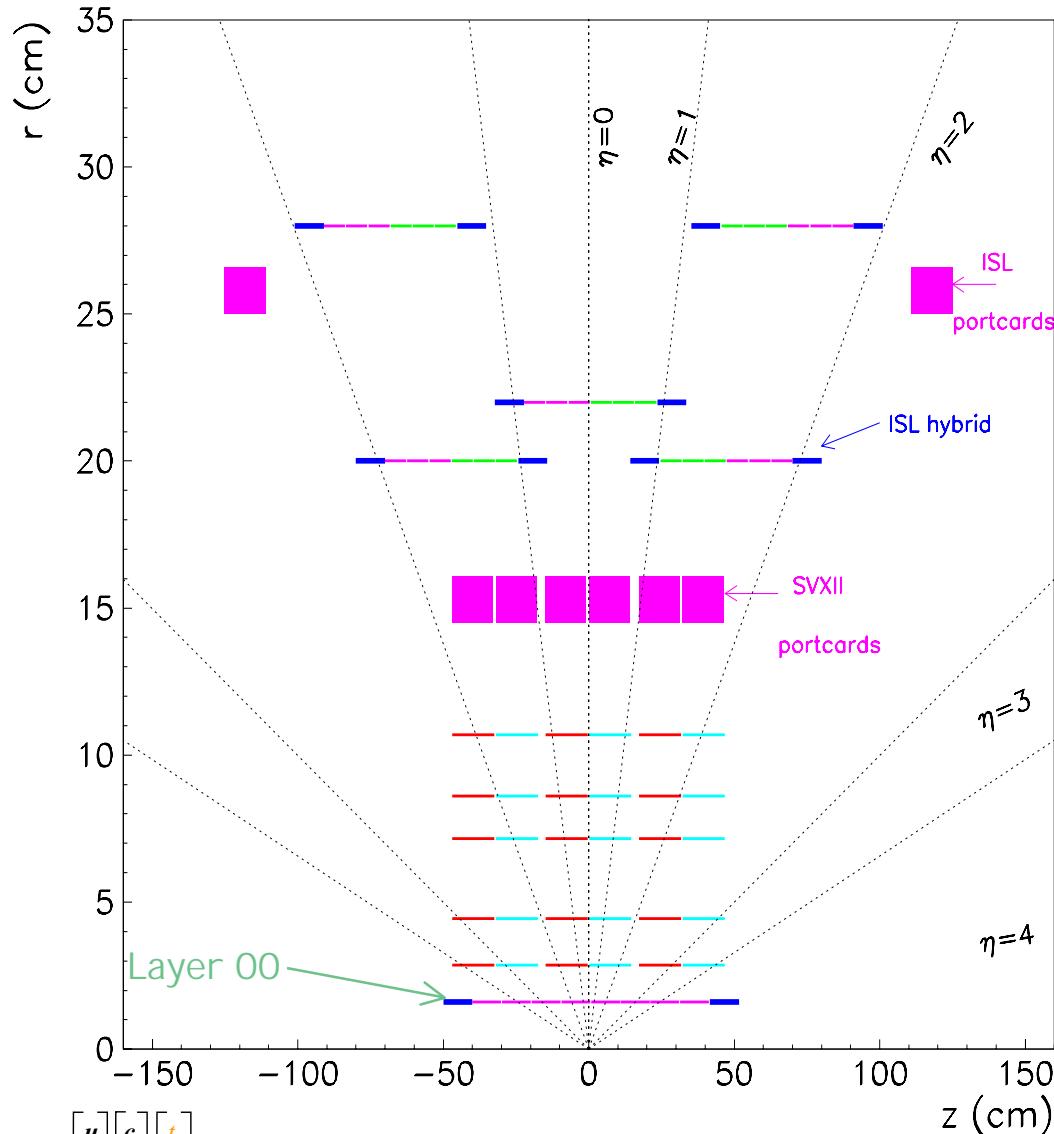

# CDF II Silicon

- SVXII (SVX)
  - Originally the only Silicon in the upgrade w/ Main Goals:
  - Extended coverage with smaller gaps in z and  $\phi$
  - 3D vertexing
  - Triggering at Level 2 on 2D displaced tracks
- ISL
  - Extend b-tagging to  $|\eta| = 2$
  - Help link tracks found in the Drift chamber to SVX
- Layer 00 (L00)
  - Improve impact parameter resolution to increase B tag efficiency
  - In the Level 2 trigger
  - Outlive inner layers of SVX

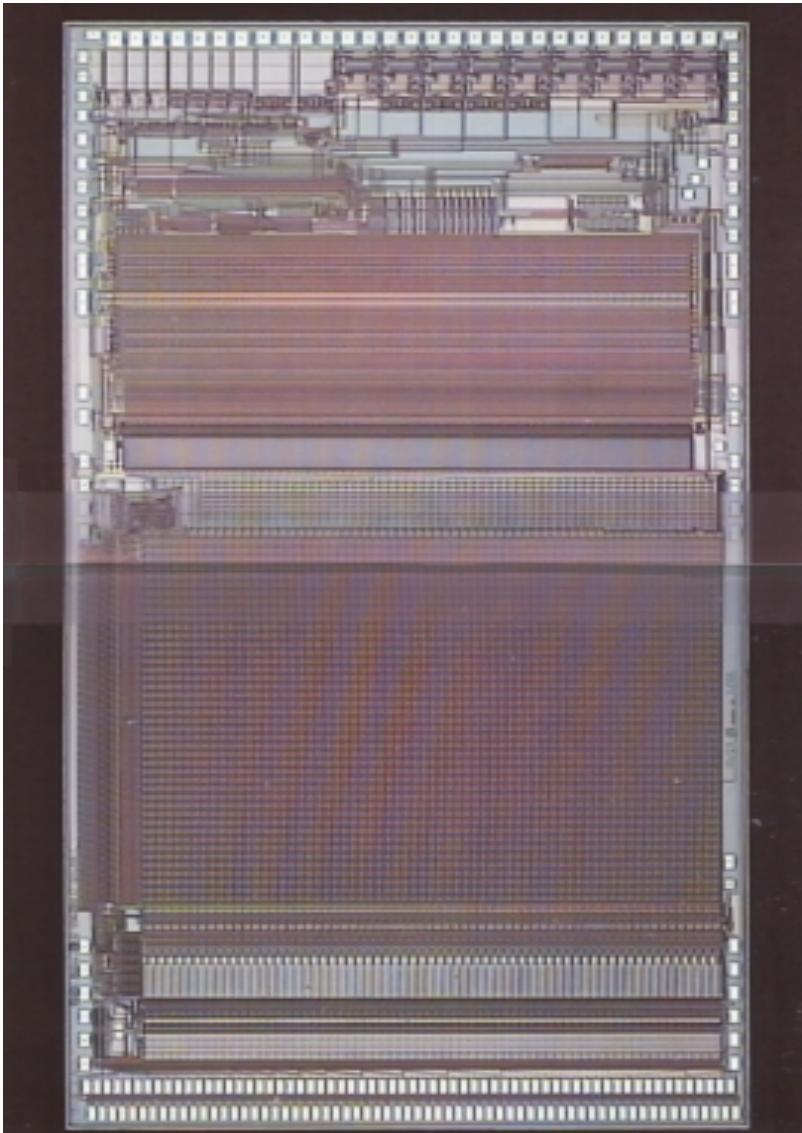

# Layout

Layer	Inner/Outer Radii [cm]	Axial Pitch [ $\mu\text{m}$ ]	Stereo Angle	Stereo Pitch [ $\mu\text{m}$ ]
1	1.35/1.62	25	-	-
2	2.5/3.0	60	90	141
3	4.1/4.6	62	90	125.5
4	6.5/7.0	60	1.2	60
5	8.2/8.7	60	90	141
6	10.1/10.6	65	1.2	65
7 Forward	19.7/20.2	112	1.2	112
7 Central	22.6/23.1	112	1.2	112
8 Forward	28.6/29.0	112	1.2	112

- All silicon is p/n
- All layers except Layer 1 are double-sided silicon
- 90 degree: Double Metal

# SVX3 Chip

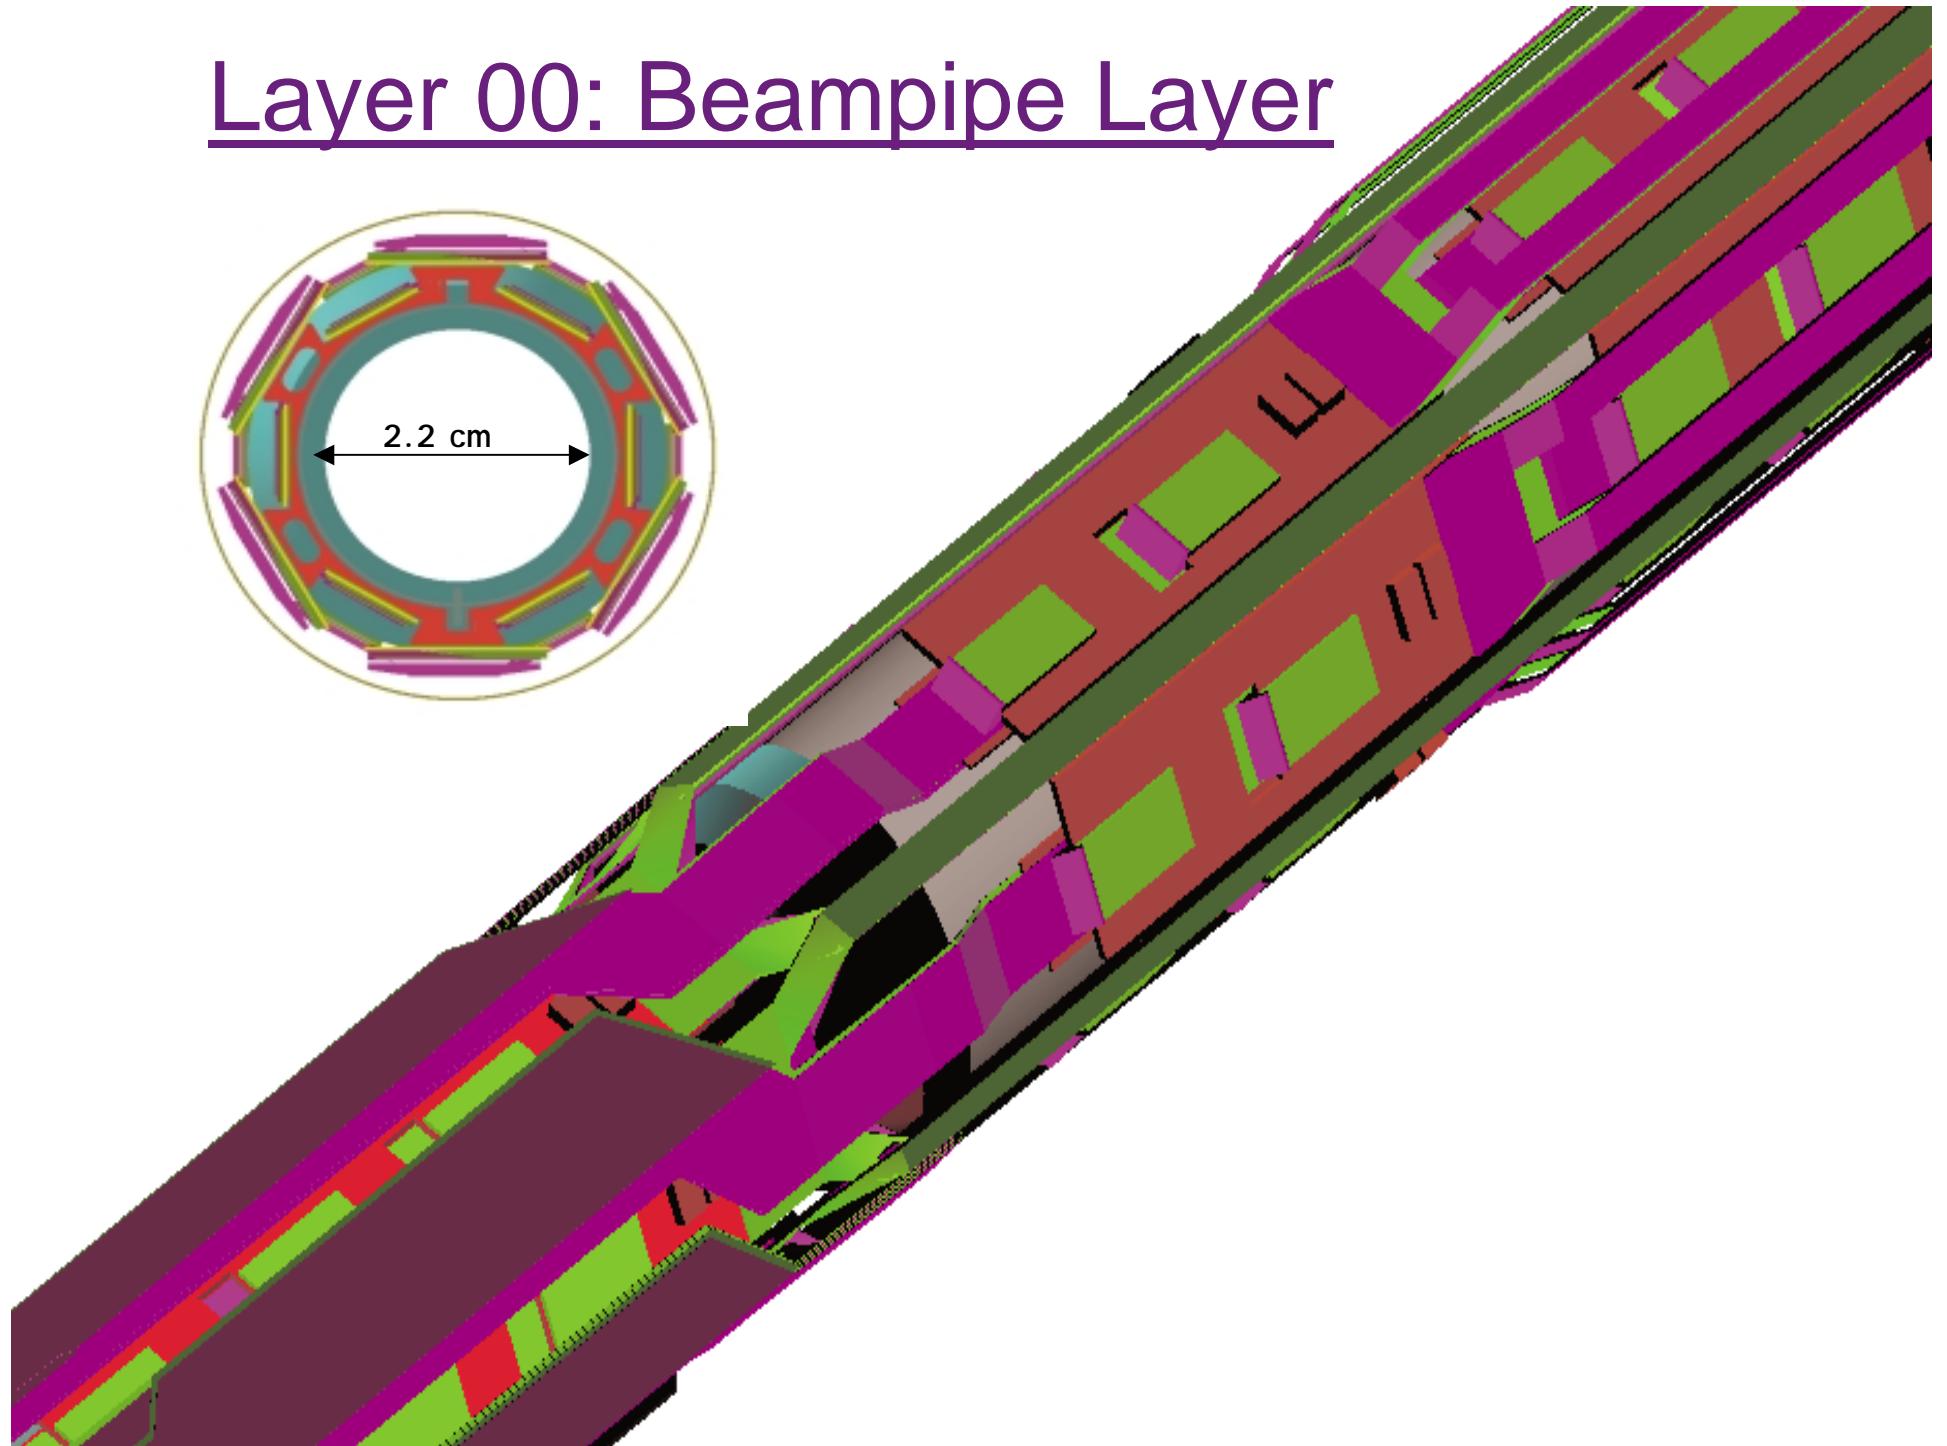

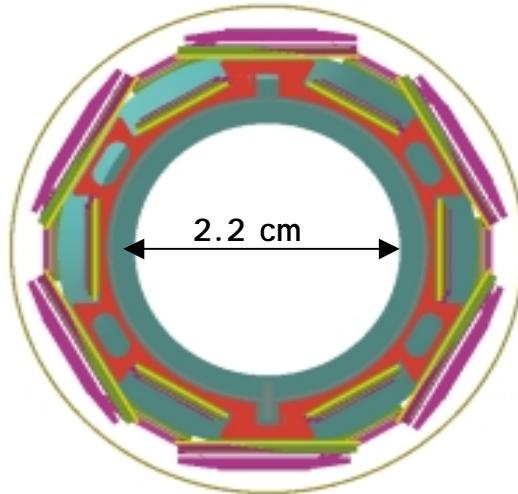

- Analog Front End (FE) and Digital Back End (BE)
  - FE has relatively low noise integrator and 42 cell analog pipeline with 4 buffer cells
  - BE has comparator, ADC, and sparse readout
- Deadtimeless:
  - Capable of analog operations during digitization and readout
- Dynamic pedestal subtraction (DPS)
  - Enables common mode noise suppression

# CDF Run 2 Silicon

Acceptance - Trileptons

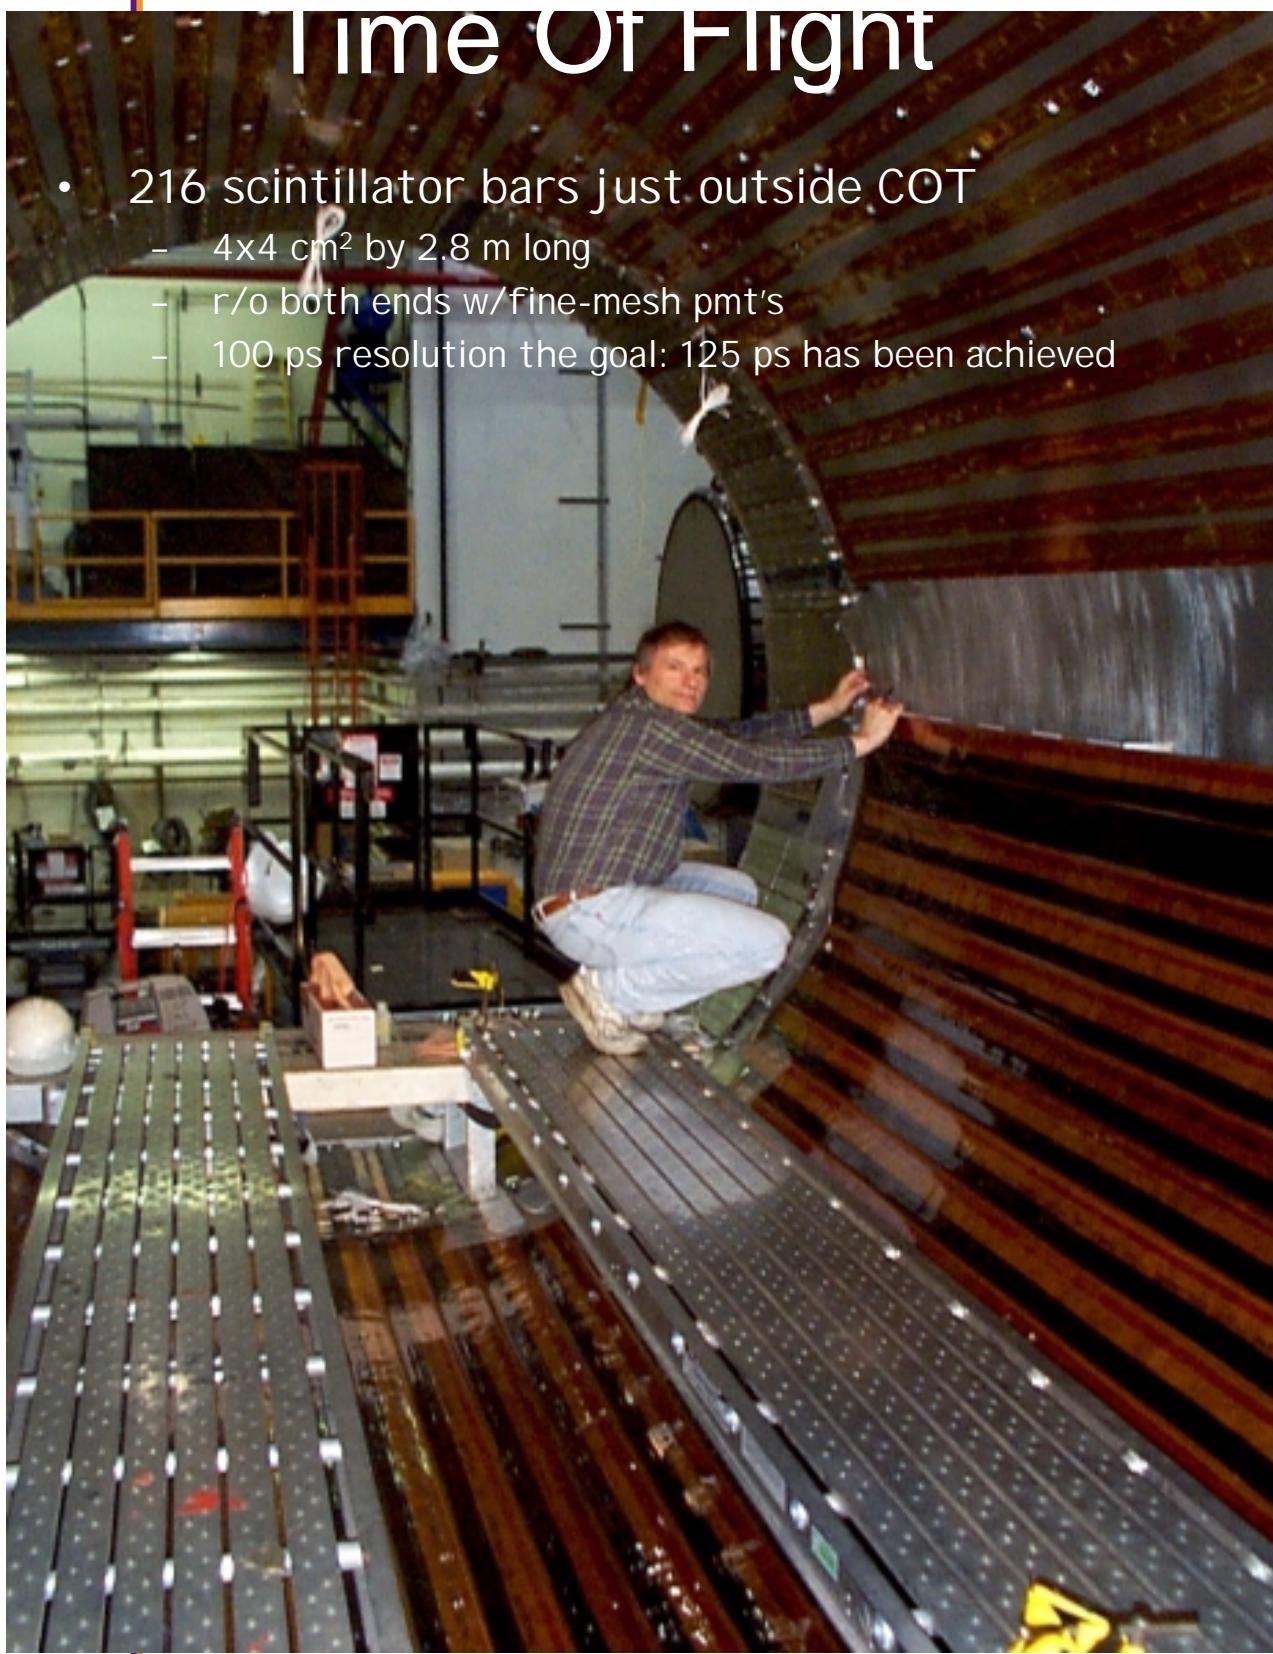

- Goal: maximum sensitivity to Higgs and SUSY in  $15 \text{ fb}^{-1}$
- Depends mainly upon 3 things:
  - B Tagging
    - For  $W/Z+H, H \rightarrow bb$  the ability to tag b jets in  $1 \leq |\eta| \leq 2$  accounts for roughly 2/3 of our sensitivity in this channel.
    - We need the highest possible b tag efficiency while also maintaining low tag rates for charm, light quark, and gluon jets.
  - Lepton id
    - For SUSY channels with 3 leptons the ability to track and determine particle momenta in  $1 \leq |\eta| \leq 2$  accounts for the majority of our sensitivity.
  - Energy resolution
    - Jet energy and missing  $E_T$  resolution need to be optimal.

# Central Outer Tracker (COT)

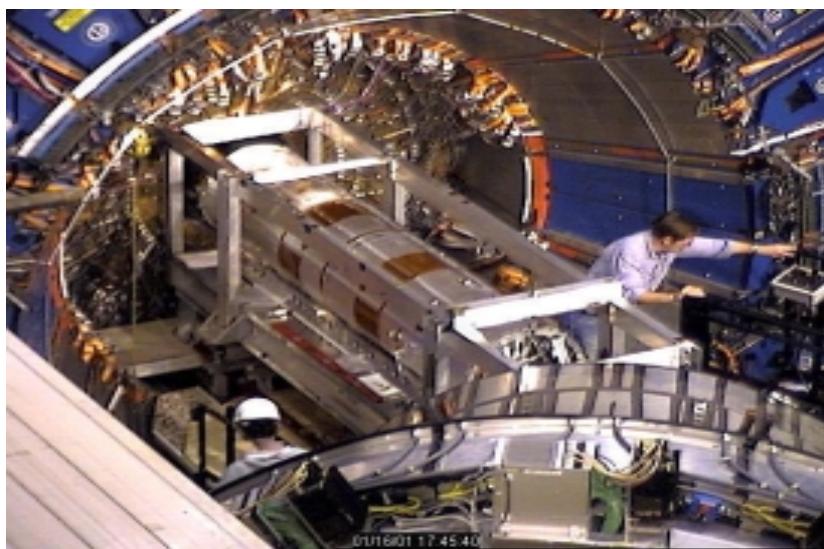

# Time Of Flight

- 216 scintillator bars just outside COT
  - 4x4 cm<sup>2</sup> by 2.8 m long
  - r/o both ends w/fine-mesh pmt's
  - 100 ps resolution the goal: 125 ps has been achieved

High Energy Physics

# Tevatron Expectations

- SM Higgs: CDF  $\oplus$  D $\emptyset$ 
  - Exclude  $M_H < 180$  GeV ( $10 \text{ fb}^{-1}/\text{exp}$ )
  - $3\sigma$  :  $M_H < 180$  GeV ( $20 \text{ fb}^{-1}/\text{exp}$ )
  - $4\sigma$  :  $M_H < 125$  and  $150 < M_H < 170$  GeV  
( $20 \text{ fb}^{-1}/\text{exp}$ )
- SUSY Higgs
  - many of the same channels as SM, enhanced association to  $bb$  at large  $\tan\beta$

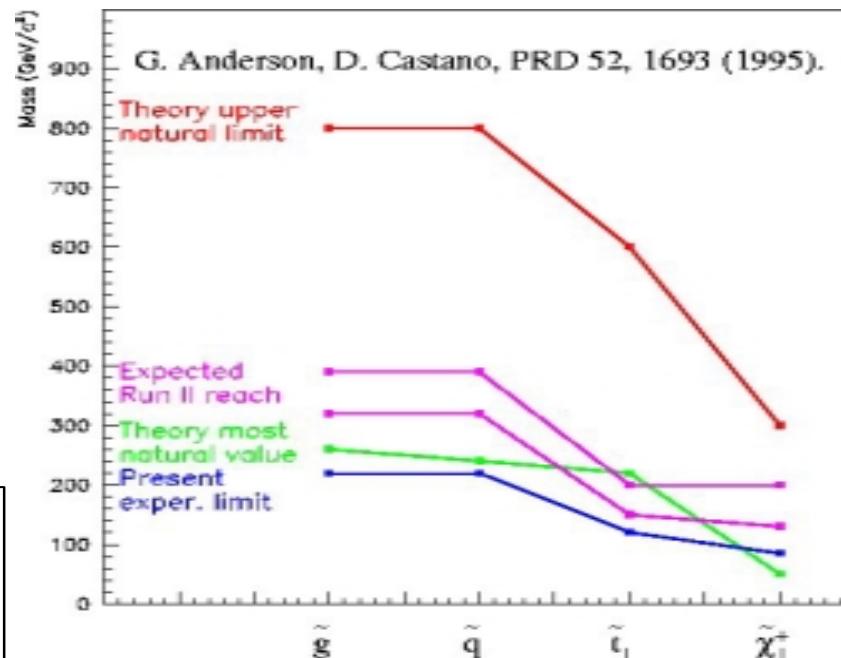

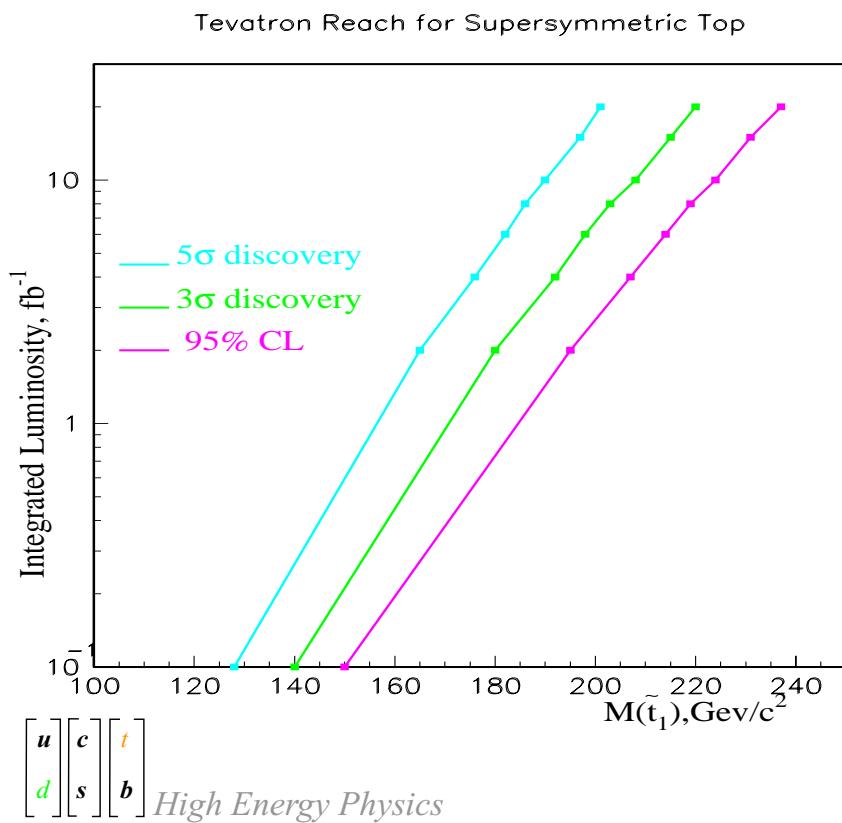

# Higgs in Top

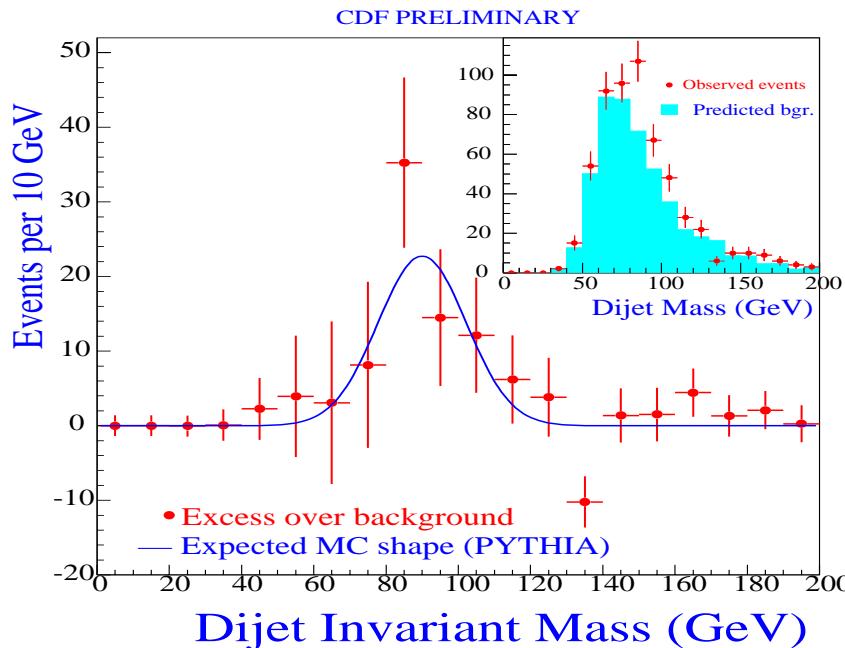

- The main background is from  $t\bar{t} + \text{jets}$ .
  - Select events with a lepton, , 3 b tags
- Reconstruct the hadronic top decay.
  - Distribute mass for all remaining jet pairs in which at least one jet is b tagged
    - This eliminates most  $t\bar{t}$ +light quark jets.
    - Majority of what remains are the irreducible backgrounds from  $t\bar{t}+bb$  and  $t\bar{t}+cc$  remain.
- Reconstructing both top quarks leaves only one pair of jets. Signal is very clear.

# SUSY at the Tevatron

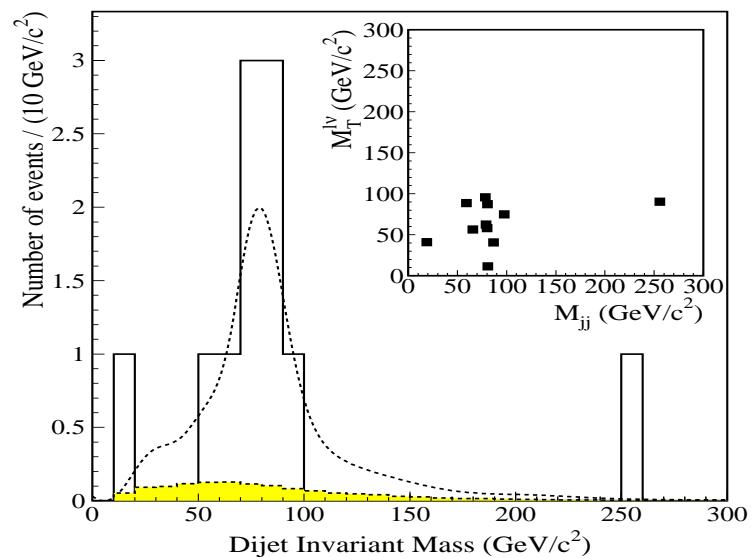

SUSY will really begin to be tested in Run 2!

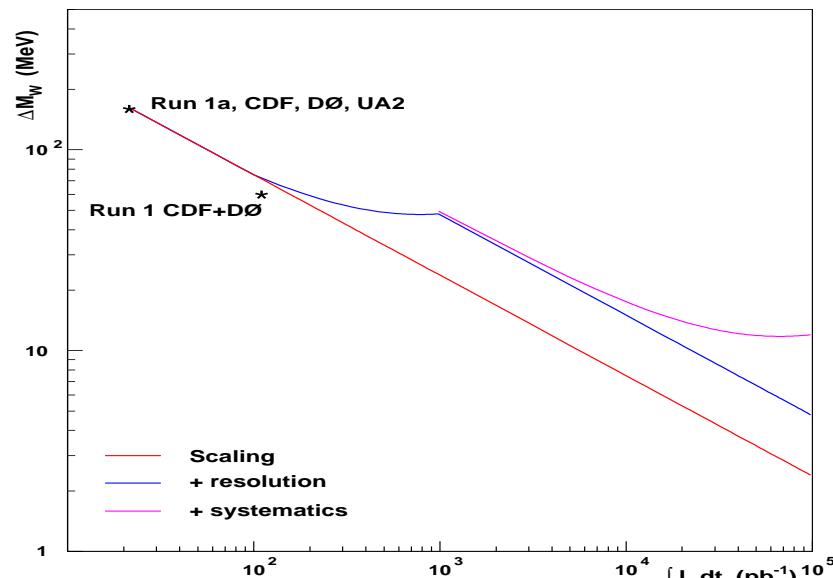

# $M_t$ Systematics

Better control of the jet energy scales in top events using samples of  $Z \rightarrow b\bar{b}$  events and by reconstructing hadronic W decays inside top events themselves.

# Precision EWK in Run 2

Precision measurements of top and W masses will severely constrain the mass of the Standard Model Higgs

$M_W$ : CDF  $\oplus$  DØ

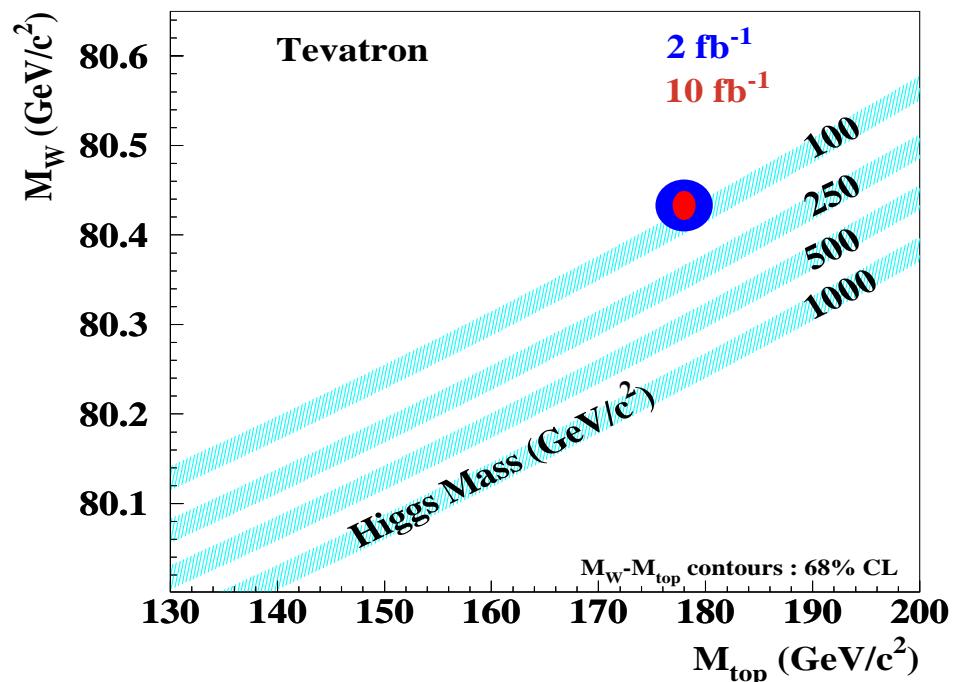

$\sigma_M \sim 35$  MeV (2  $\text{fb}^{-1}$ )

$\sigma_M \sim 20$  MeV (10  $\text{fb}^{-1}$ )

$M_t$ : CDF or DØ

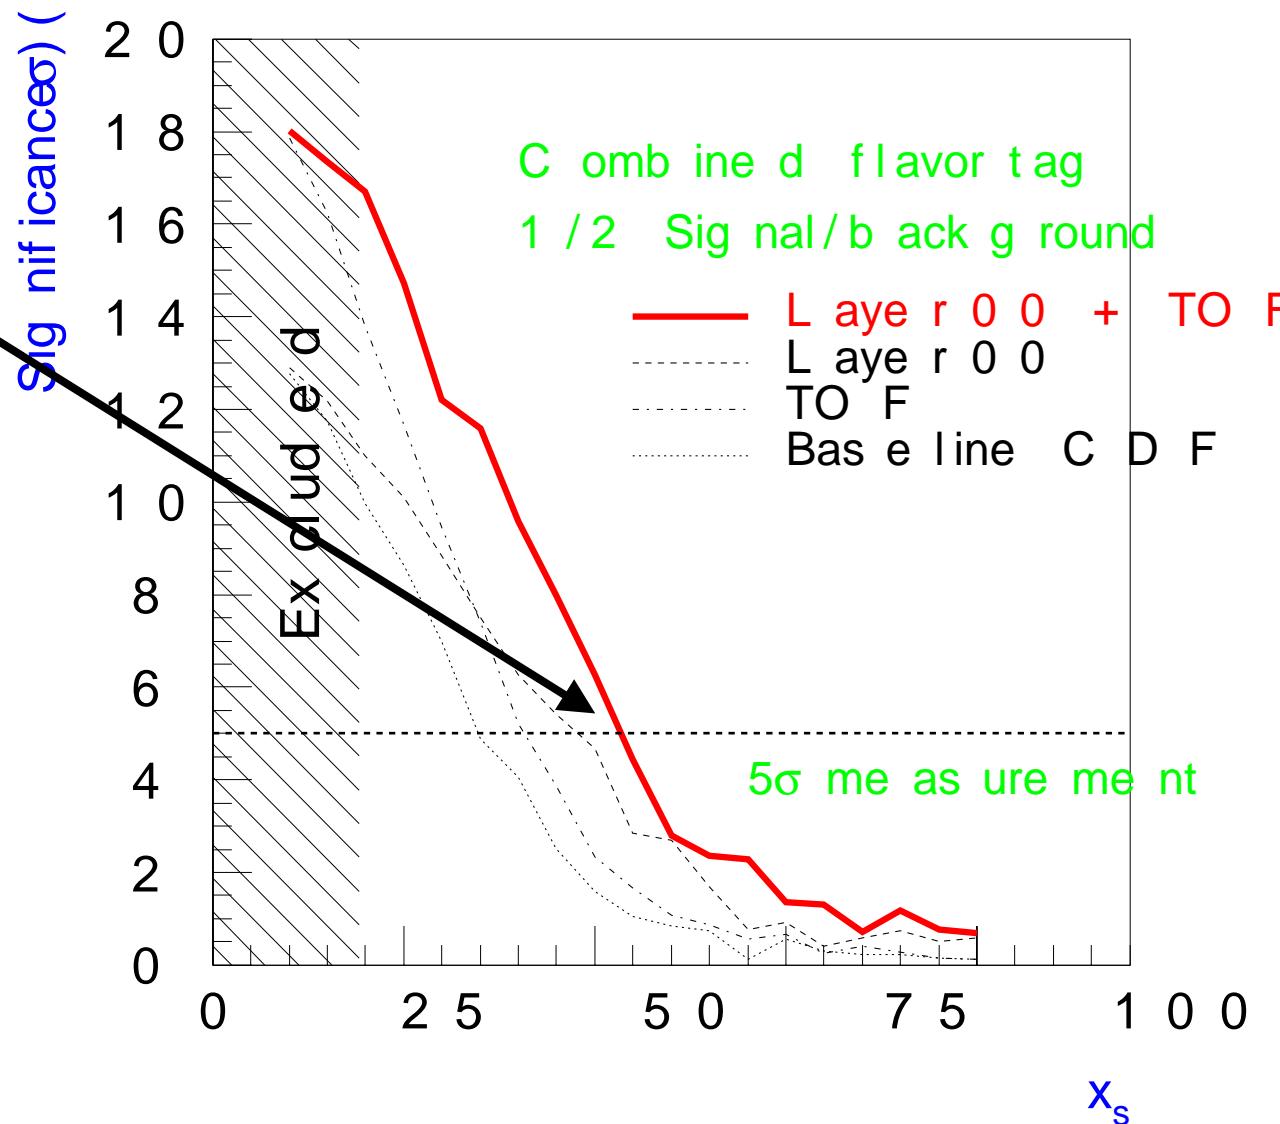

$\sigma_M < 4$  GeV (2  $\text{fb}^{-1}$ )

$\sigma_M < 2$  GeV (10  $\text{fb}^{-1}$ )

---

- Two-pronged Attack
  1. Physics beyond the standard model (e.g. SUSY) via multiple high energy leptons:
    - Start by developing special lepton identification tools to enable us to extend our sensitive range
    - With initial low-luminosity we'll measure W decay asymmetry:
      - Determines the quark content of the proton which is a major uncertainty in the W mass determination
    - Having developed a high degree of expertise, start searching for new physics as data comes in
  2. Higgs and top physics
    - Start studying tracking and b tagging. In combination with lepton identification, use these tools to study top quark events:
    - With initial low-luminosity we'll begin to study the rate at which additional jets are produced with top quarks:
      - Determines strong coupling at the top mass which is a major source of uncertainty in the top mass determination
      - This is also the main background to top+Higgs
    - Having developed a high degree of expertise, start searching Higgs decaying to b jets in a variety of channels as data comes in.

# Higgs at the CERN Large Hadron Collider

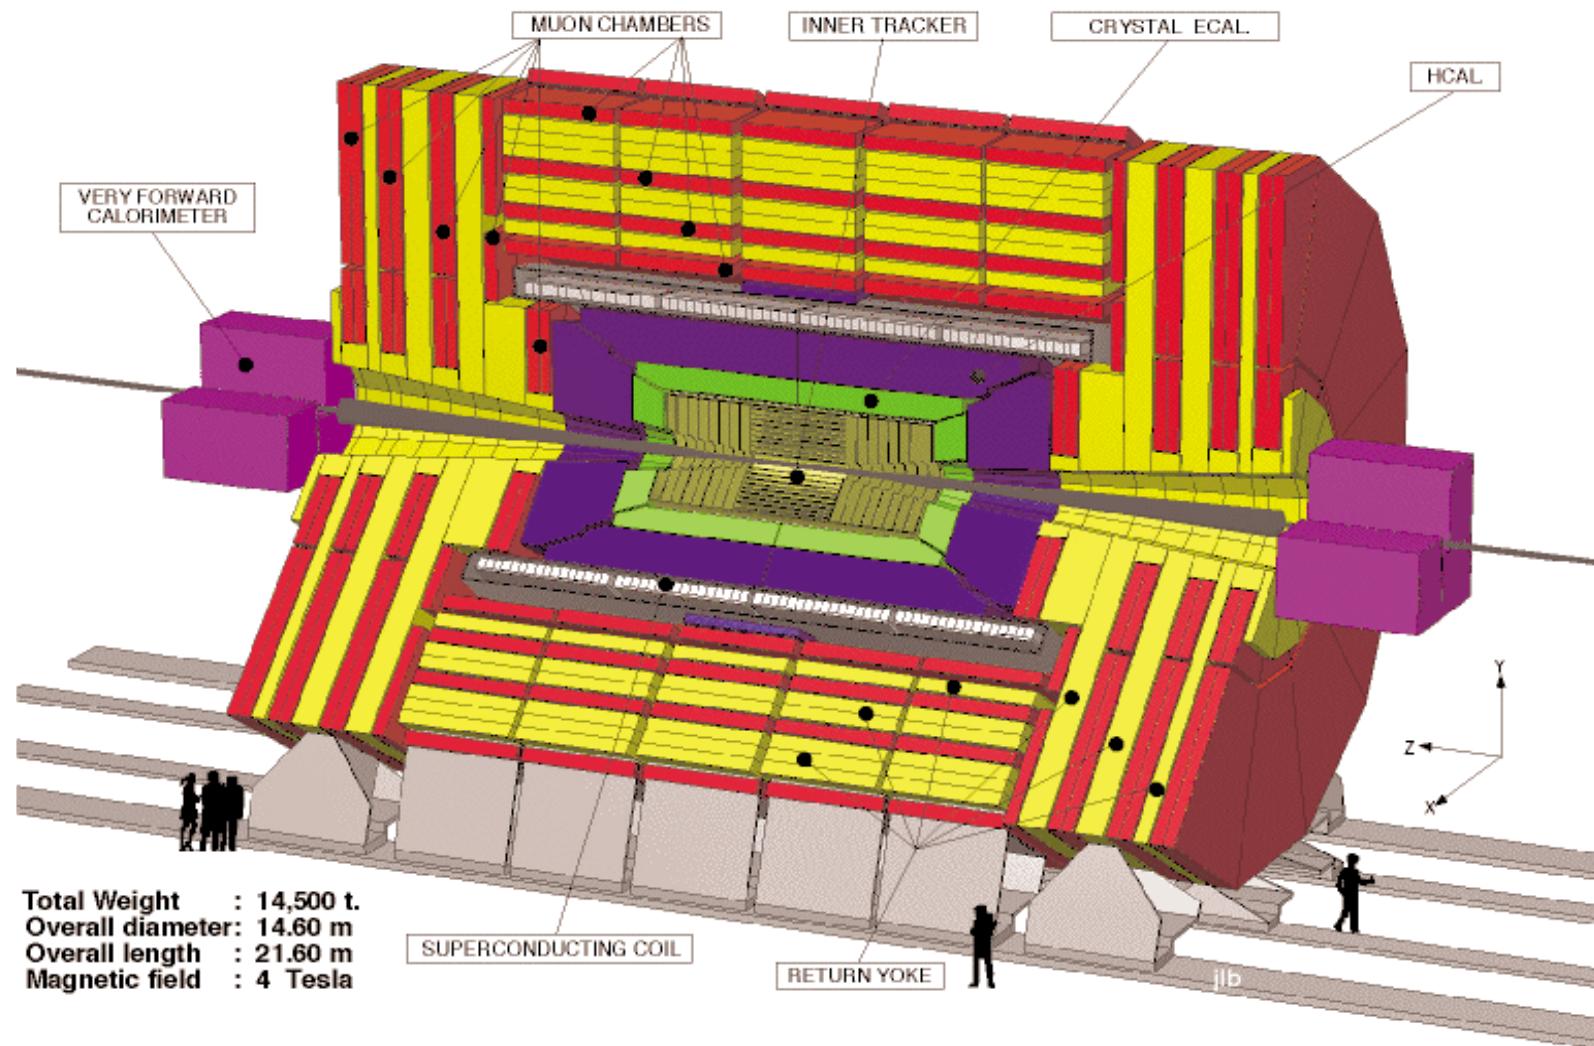

- SM Higgs Search strategies
  - $H \rightarrow bb$   $90 \leq m_H \leq 120 \text{ GeV}/c^2$
  - $H \rightarrow \gamma\gamma$   $100 \leq m_H \leq 140 \text{ GeV}/c^2$
  - $H \rightarrow ZZ^* \rightarrow 4l^\pm$   $130 \leq m_H \leq 200 \text{ GeV}/c^2$
  - $H \rightarrow WW \rightarrow llvv$   $140 \leq m_H \leq 200 \text{ GeV}/c^2$
  - $H \rightarrow ZZ \rightarrow 4l^\pm$   $200 \leq m_H \leq 750 \text{ GeV}/c^2$

# Construction underway

# All Silicon Tracker

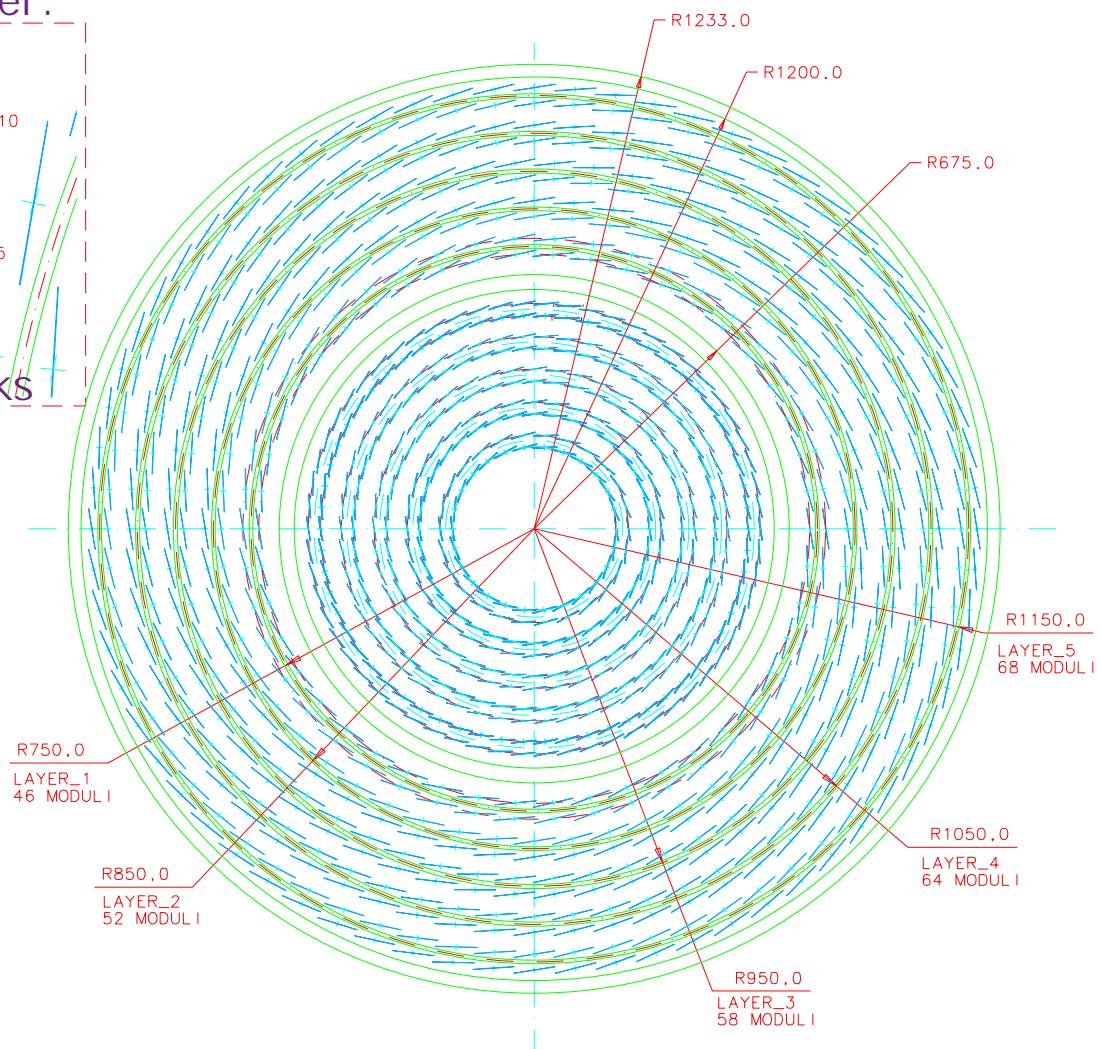

## The CMS Silicon Tracker:

- 2 pixel layers
- 4 inner silicon layers
- 6 outer silicon layers
- Forward pixels
- 9 Forward Silicon disks

Total of  $230 \text{ m}^2$  of  
Silicon microstrips

Of this  $\sim 110 \text{ m}^2$  will be  
built by US CMS.

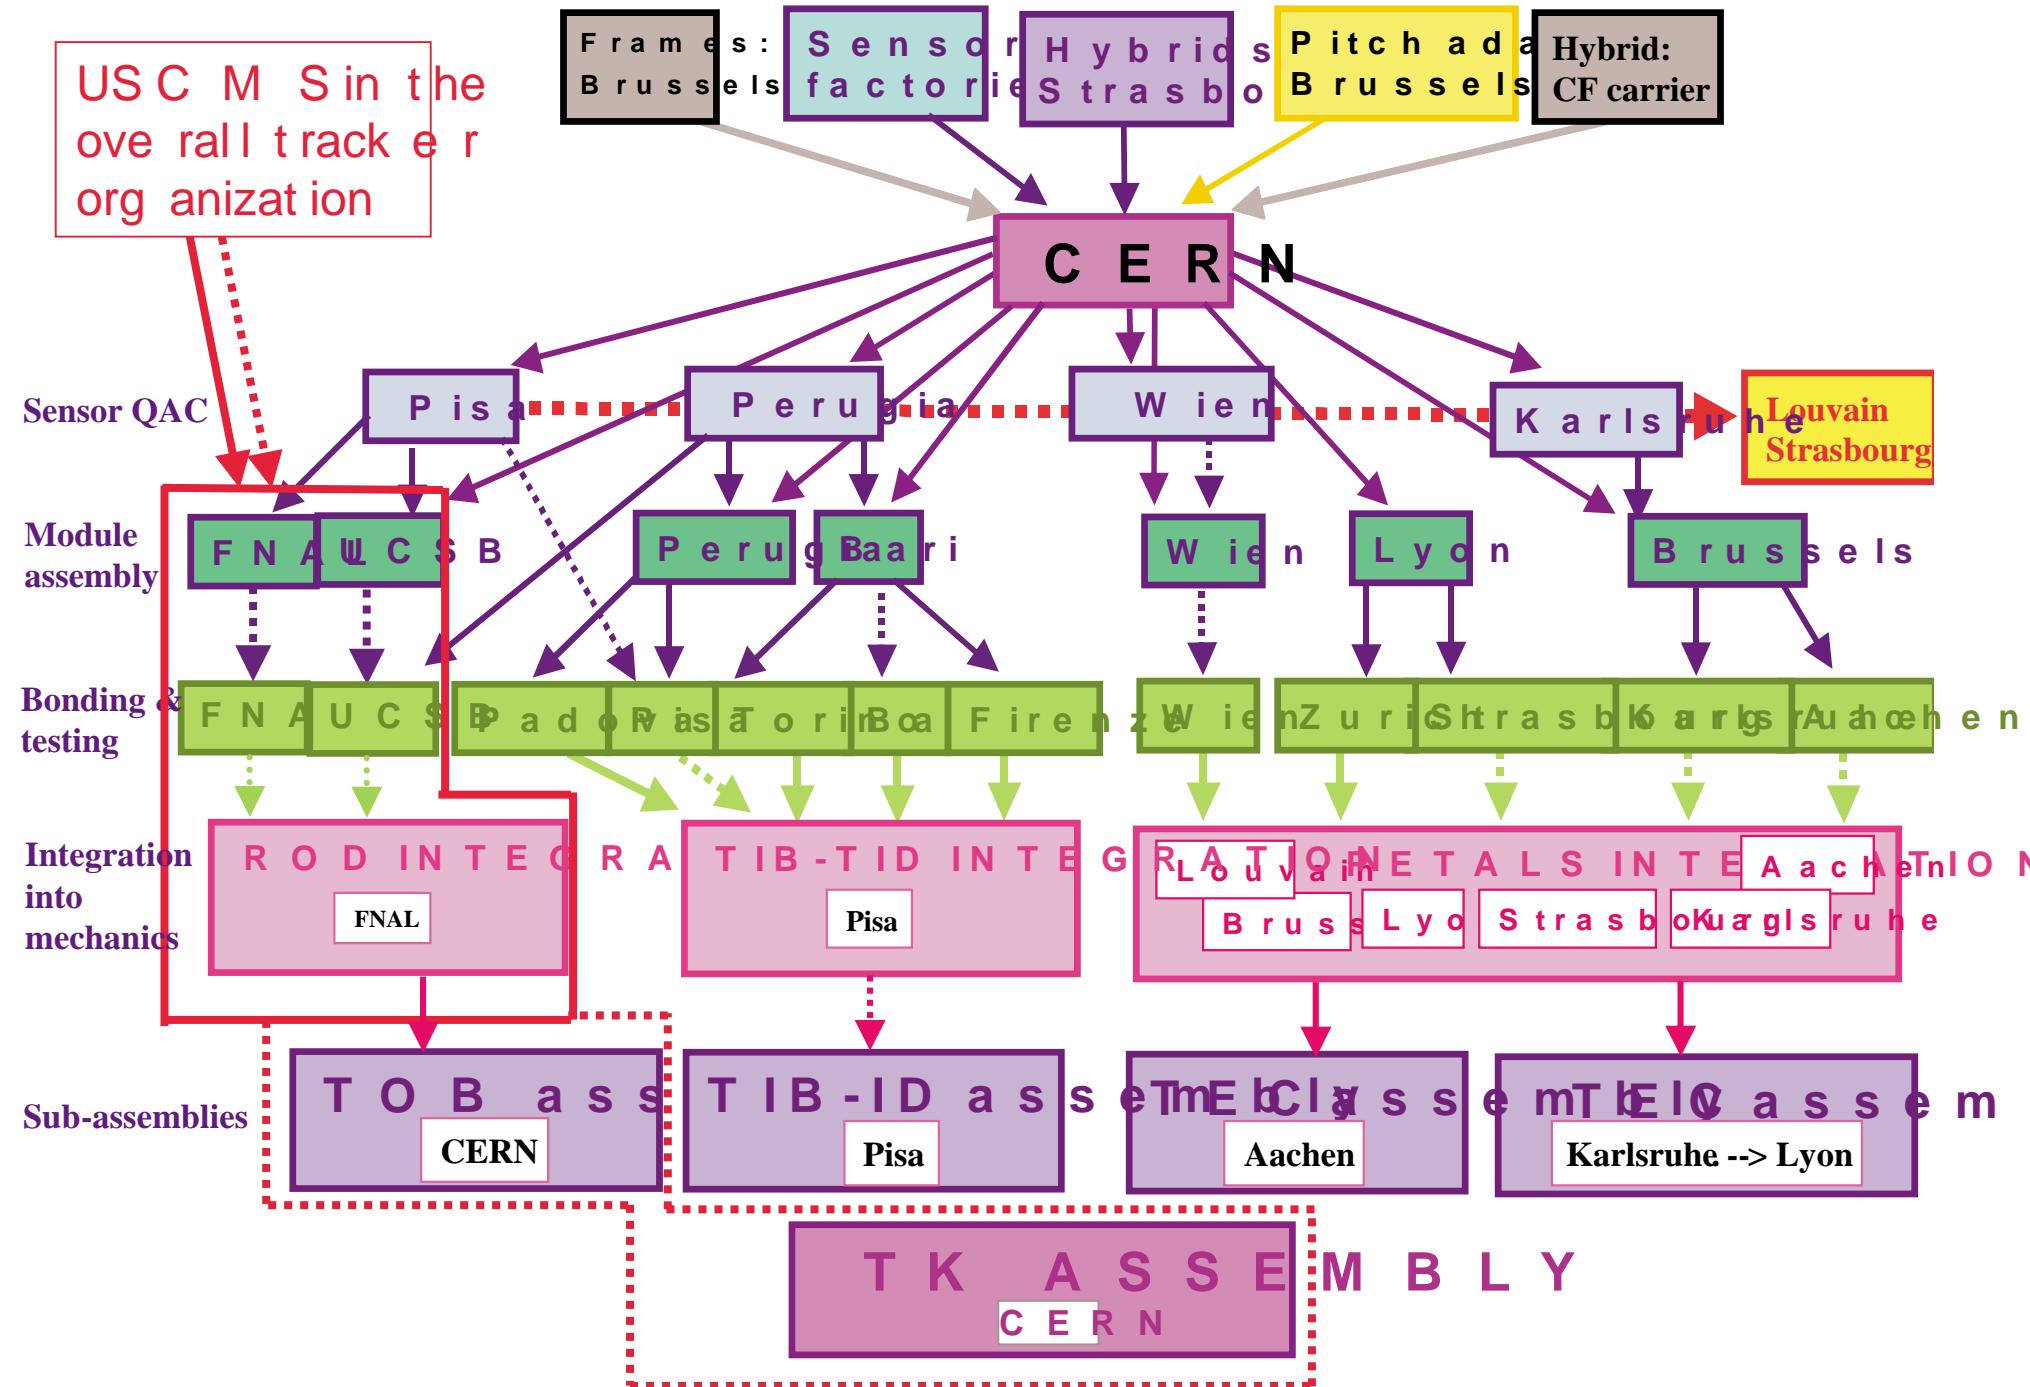

**UCSB will build  $30-50 \text{ m}^2$**

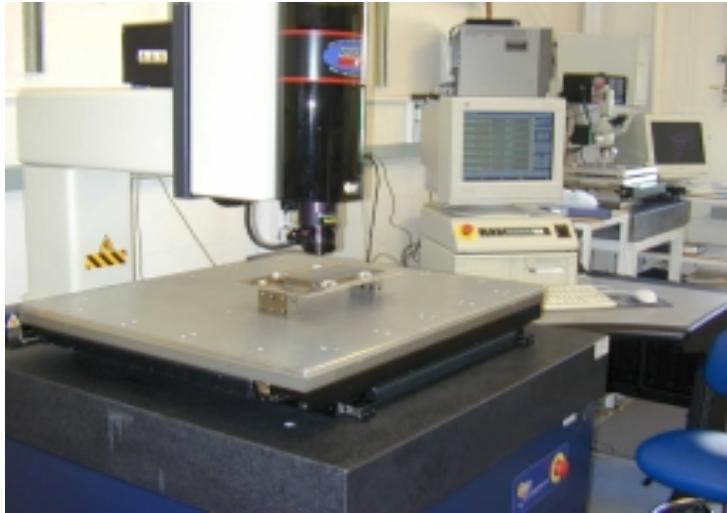

$$\begin{bmatrix} u \\ d \\ s \\ b \end{bmatrix} \begin{bmatrix} c \\ t \end{bmatrix}$$

ganization

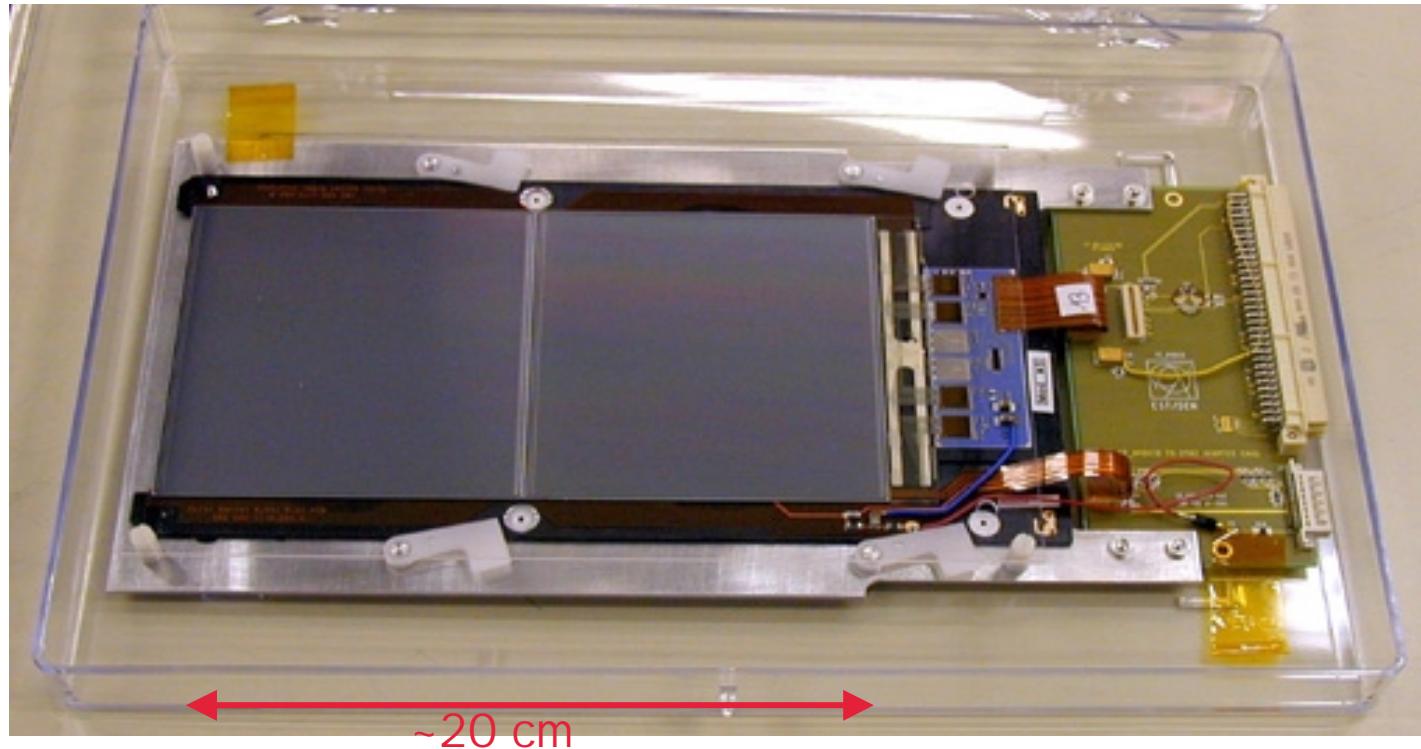

# UCSB Production Line

- Significant progress.
  - Clean room expanded.
  - K&S 8090 wirebonder up and running, practicing on Babar modules.
  - OGP functioning – for automated mechanical inspection of modules.
  - Gantry arrived in March, now being setup.
- New groups (UCR, and TTU) will support production line at UCSB.

# Our Job

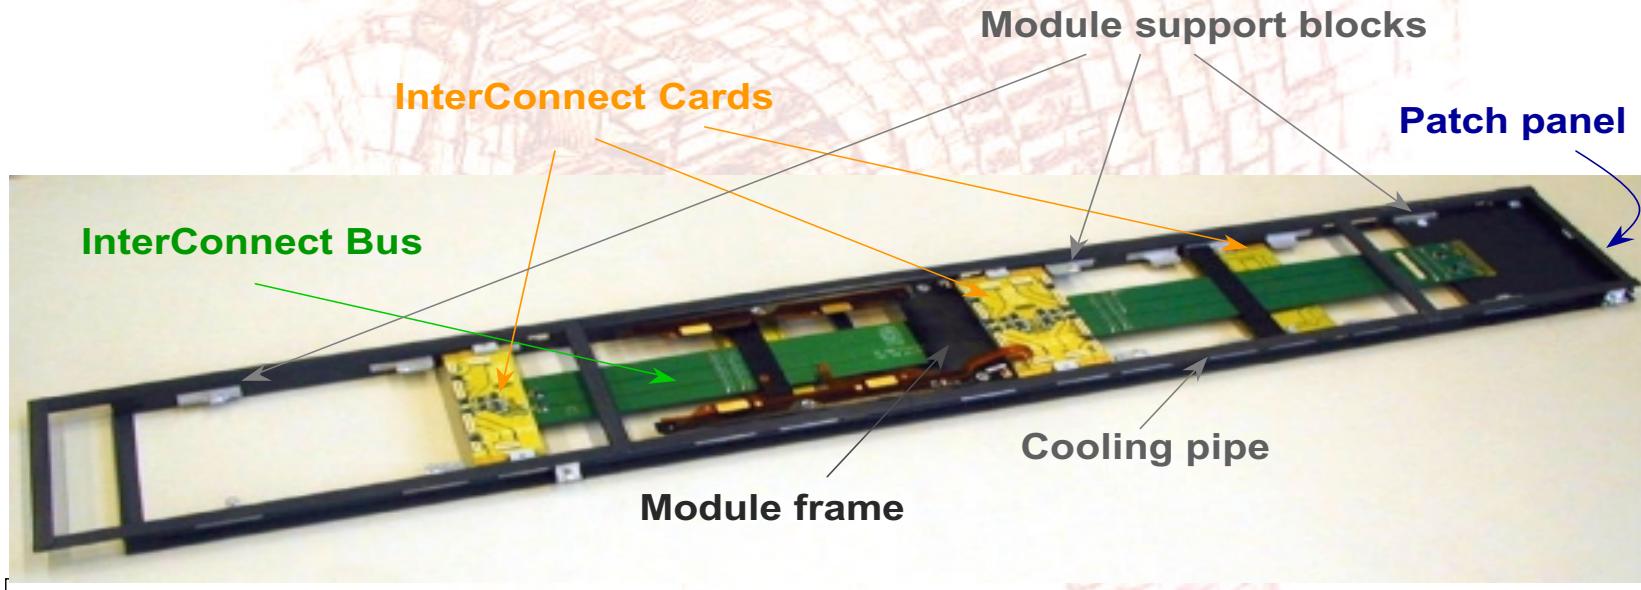

---

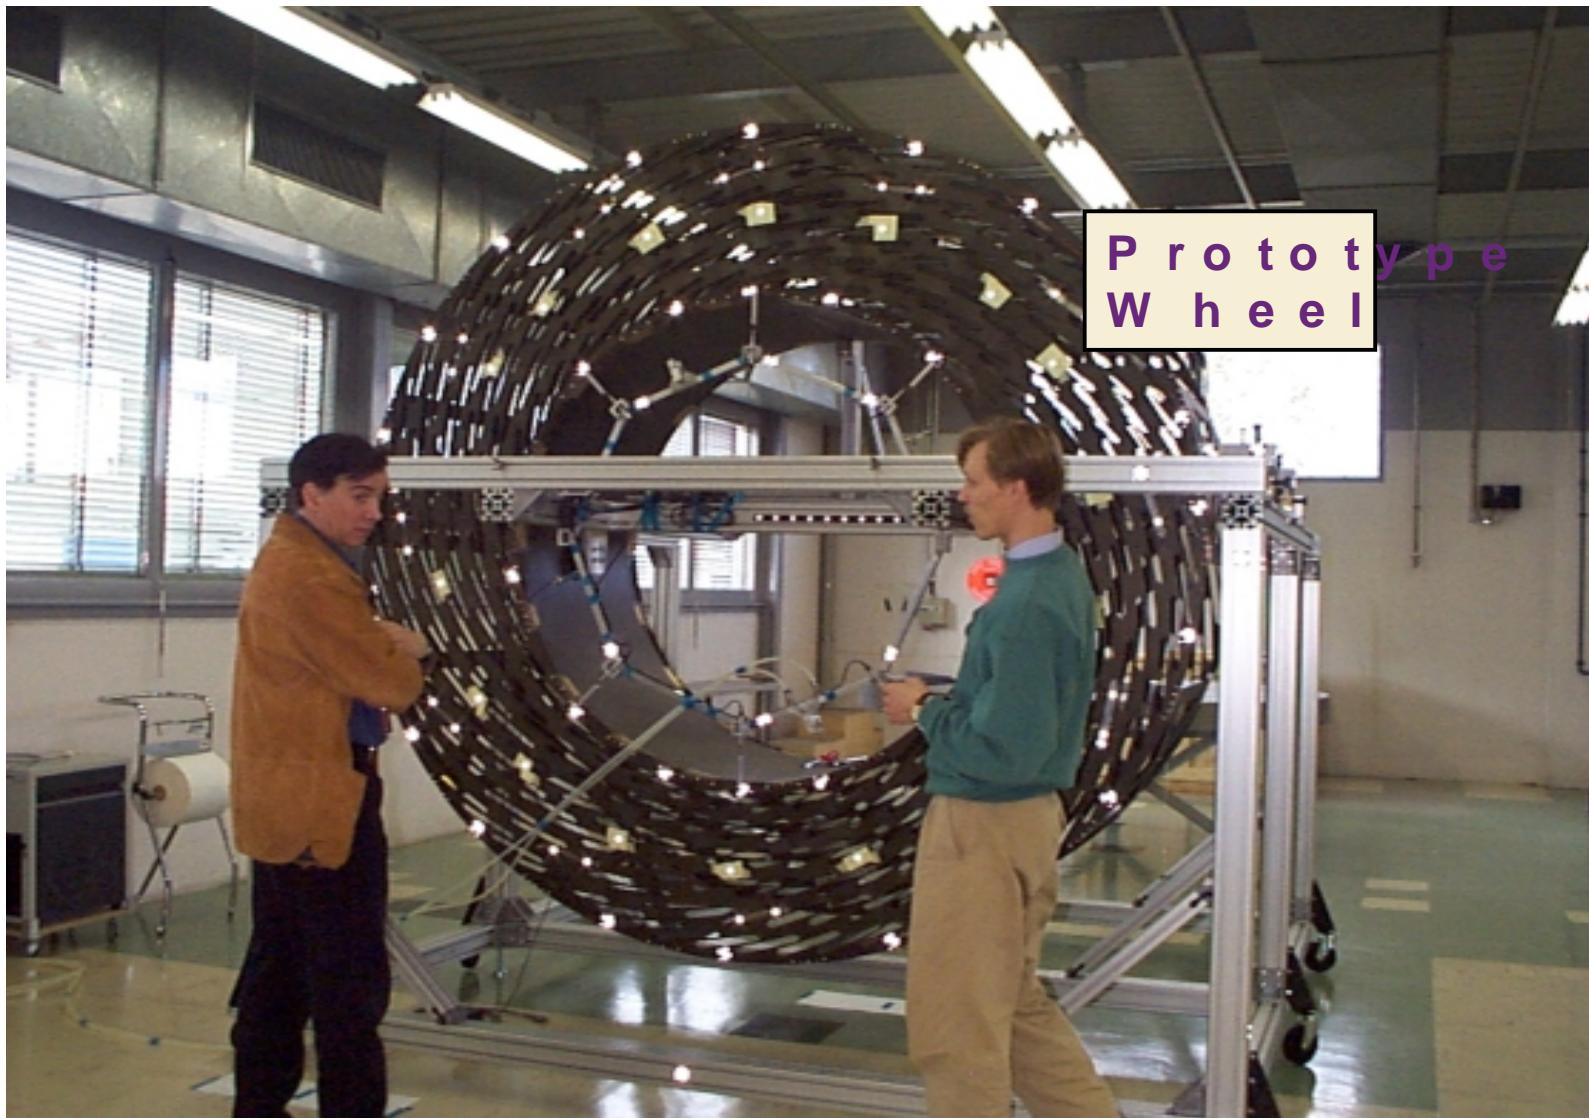

~6,000 Tracker Outer Barrel (TOB) modules  
Current plan 2/3:1/3 constructed at FNAL:UCSB

# Rod s

- 6 (12) Modules per single (double) sided rod
- Preliminary tests complete
  - Interconnect bus and cards tested with 1 hybrid and 1 opto-hybrid
    - Nice results: Signals are extremely clean
    - Conclusive test requires full load (12 hybrids and opto-hybrids) planned for later this Spring

# Support Structure for Rods

$$\begin{bmatrix} \mathbf{u} \\ \mathbf{d} \end{bmatrix} \begin{bmatrix} \mathbf{c} \\ \mathbf{s} \end{bmatrix} \begin{bmatrix} \mathbf{t} \\ \mathbf{b} \end{bmatrix}$$

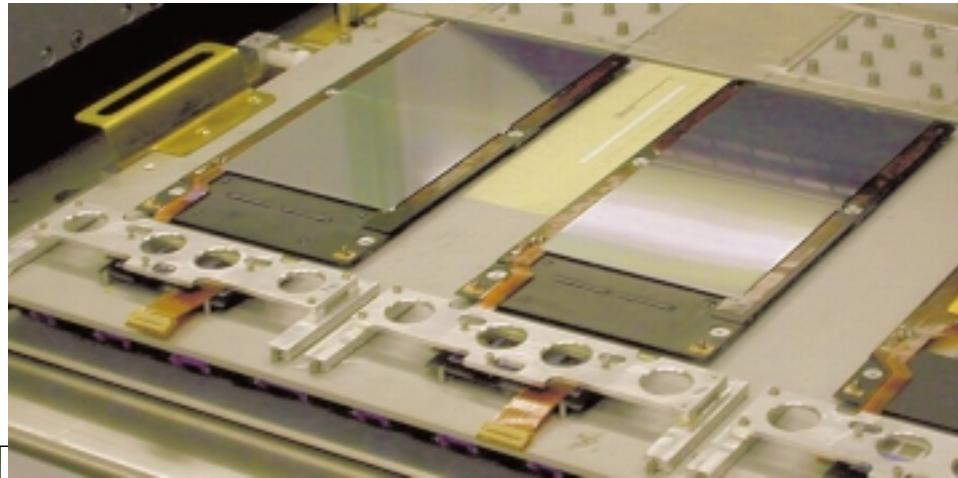

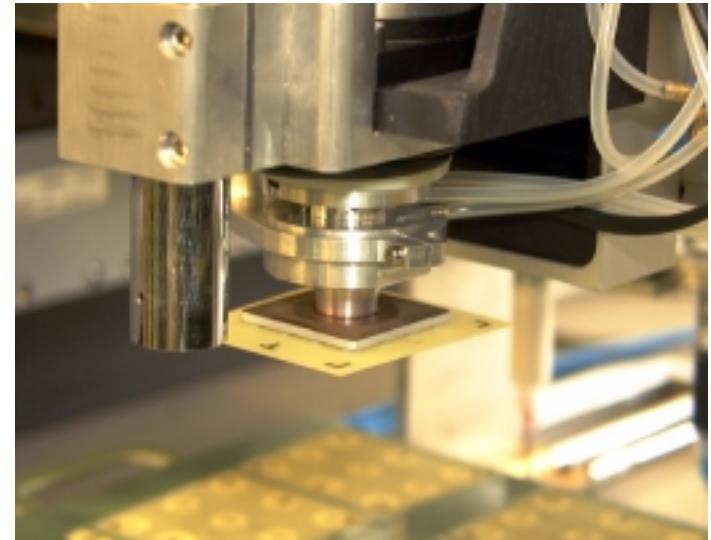

High Energy Physics

# Automation

---

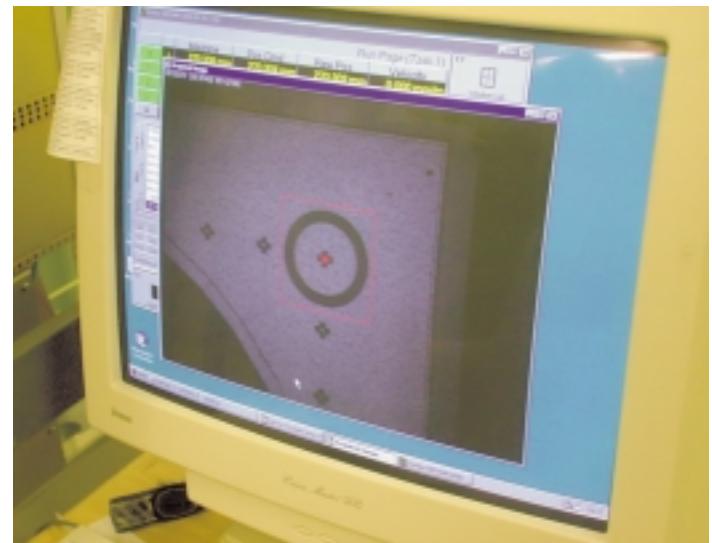

Special robot - GANTRY - was developed for assembling CMS Silicon tracker components.

Positioning accuracy  $\pm 1.6 \mu\text{m}$   
Production time 10 min/module

# UCSB Contributions to CDM

- Inception - Dave Caldwell
- Shielding - both I and II
  - Hale, Kyre, Callahan (Technical)
  - Yellin (Design)
  - Bauer, Bunker (Grad), R. Nelson (Ugrad) (Implementation)
  - Crucial for the discovery of WIMPs
- Data Acquisition
  - Soudan Underground Facility (SUF):
  - CDMS I - largely the work of Dan Bauer
  - CDMS-II a new challenge -
    - scale up
    - remote operations
    - conversion and overhaul to more modern practices
      - trigger electronics (Sam Burke)
      - software: Java, Corba, event-builder
  - Rupak Mahapatra, Dan Bauer, Don Holmgren (FNAL)
    - UCSB Grads Ron Ferril, Joel Sander, Chris Savage
- Management
  - Dave Caldwell - chair of the Executive Committee
  - Dan Bauer - chair of the Experiment Integration and Coordination committee; subsystem manager (Shield)
  - Harry Nelson - subsystem manager (DAQ)
  - Steve Yellin - chair of the Monte Carlo group
- Operations
  - Dan Bauer coordinates at SUF Steve Yellin is computer system manager
- Analysis
  - Steve Yellin Background simulation
    - Statistical Analyses
  - Ray Bunker
    - Veto
    - Ph. D. Thesis - Soudan or SUF/new run

$$\begin{bmatrix} \mathbf{u} \\ \mathbf{d} \end{bmatrix} \begin{bmatrix} \mathbf{c} \\ \mathbf{s} \end{bmatrix} \begin{bmatrix} \mathbf{t} \\ \mathbf{b} \end{bmatrix}$$

# Data Acquisition: DAQ

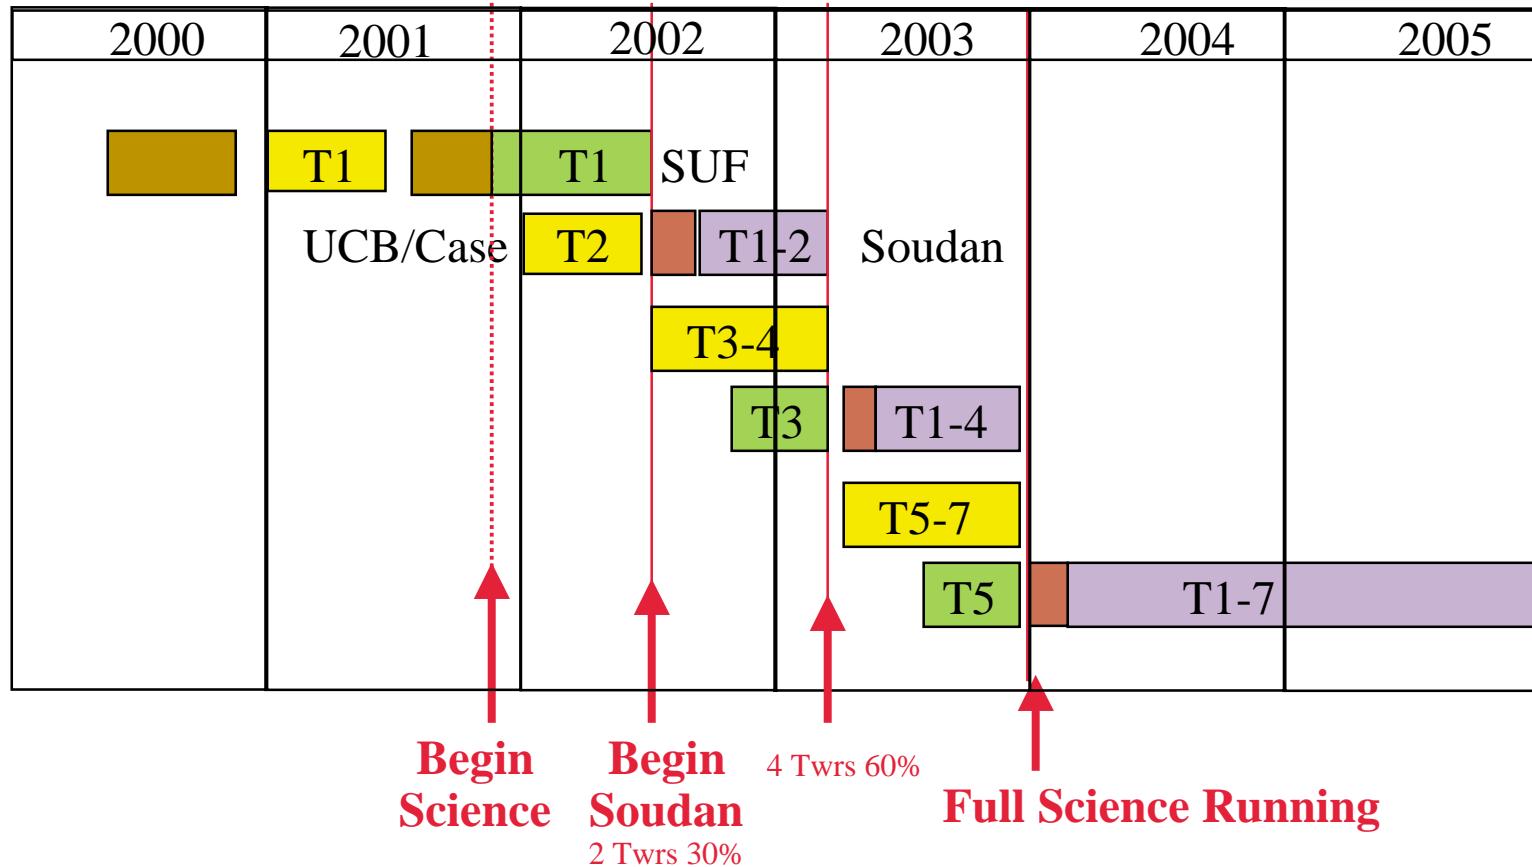

# The Future

---

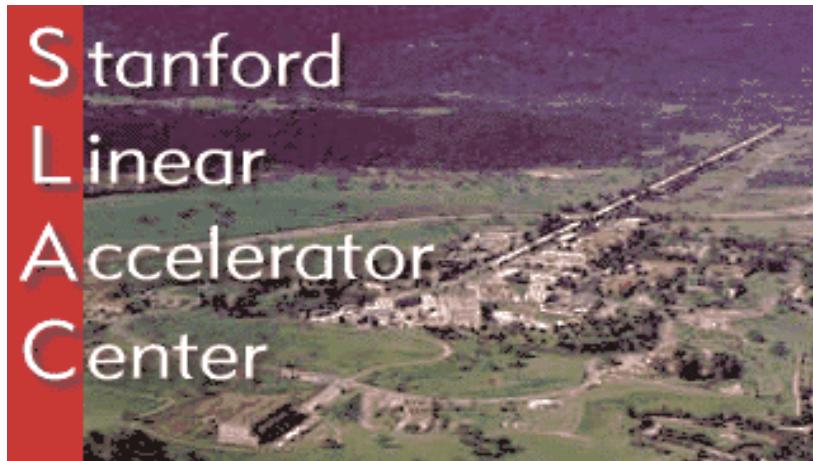

- CDMS-II
  - SUF Run underway - all positive - Dan Bauer will talk
  - Soudan - Crunch Time -
    - DAQ, shield operational this spring
    - Summer - running commences (Towers in July) (next)
    - 3-4 Dissertations from UCSB
  - 2003 - CDMS-II/Soudan measured (expect internal backgrounds about twice Soudan neutrons)
- Next step?
  - Desire for sensitivity as far as we can go
  - Background experience at CDMS-II crucial

# New Scenario 2 - 4 - 7

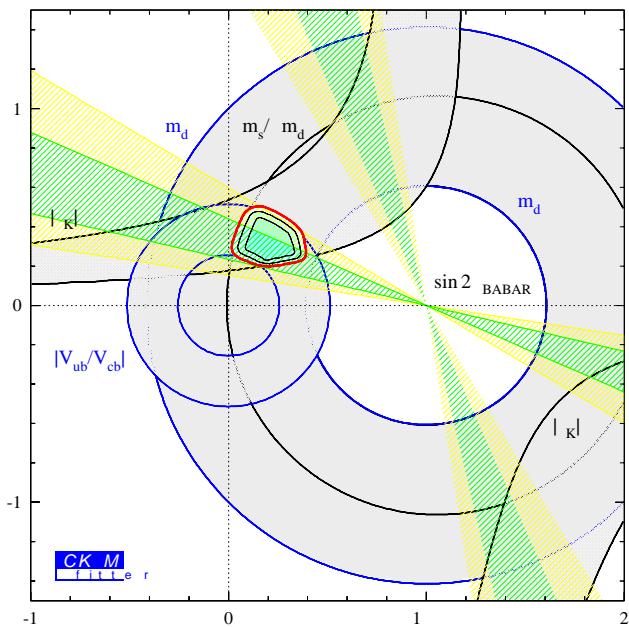

# The Babar Experiment at SLA

Campagnari, Richman

- Babar experiment looks at b and b-bar mesons produced in e+e- collisions.
  - Primary goal of this experiment and its competition (the Belle experiment at KEK in Japan) is the observation of CP violation in the b quark sector
  - CP violation was Recently Observed at both experiments !
- UCSB played a major role in both the construction of the detector and the data analysis

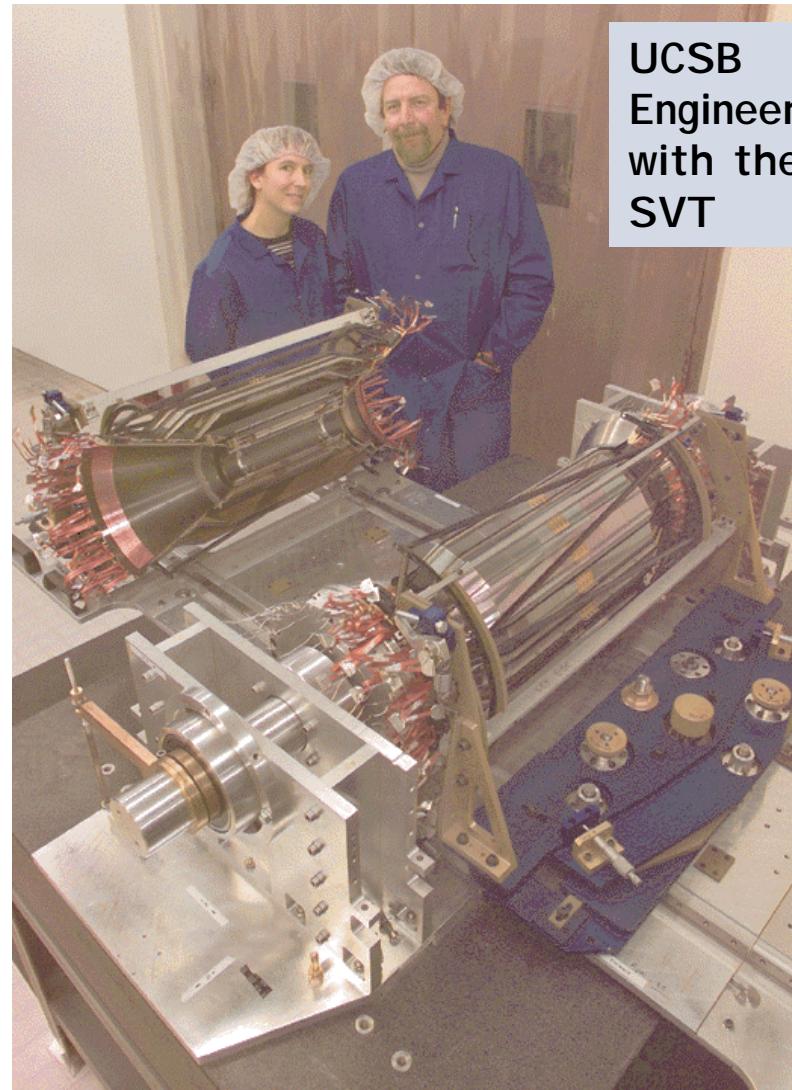

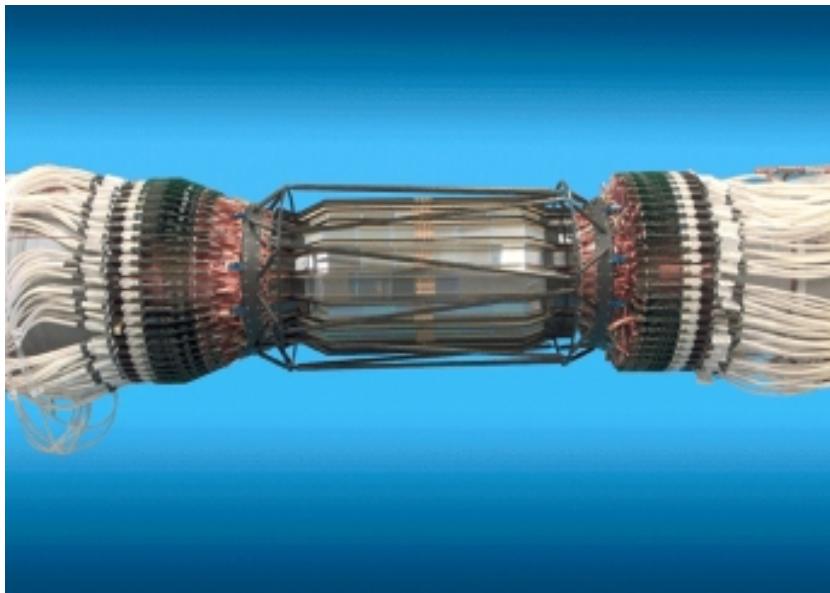

$\text{Sin}2\beta$  is a relative measure of the asymmetry of neutral B and Bbar meson decay rates to  $\Psi + K_S$ . A non-zero value means CP is violated

The Babar result is shown above in the  $p-\eta$  plane.

$$\begin{bmatrix} u \\ d \end{bmatrix} \begin{bmatrix} c \\ s \end{bmatrix} \begin{bmatrix} t \\ b \end{bmatrix} \text{High Energy Physics}$$

# Babar SVT

The Babar Silicon Vertex Tracker (SVT) is crucial to the  $\sin 2b$  measurement. Much of the design and construction of this detector was the responsibility of the UCSB HEP group and was performed at UCSB.

  - Currently hiring another engineer...

# How do students fit in?

---

- These experiments depend heavily on graduate students.
- Each analysis topic generally involves only a very small fraction of the collaboration.
  - Students can and regularly do make enormous individual contributions to major measurements and major discoveries
    - e.g. top quark
  - The advantages of a large collaboration far outweigh any disadvantages
    - Experts of all stripes are available
    - Work daily with excellent physicists from every great physics department and institute worldwide
    - Truly an international undertaking

# C onclusions

---

- The UCSB group is playing key roles in key experiments
  - The search for Dark Matter
  - CP violation in the b quark sector
  - Search for the Higgs and SUSY
- Key contributions to the Babar, CDF and CDMS and CMS
- We have pretty exciting times ahead...
